Unit Strategic Fire Plan developed for the Sonoma-Lake-Napa Unit:

This Plan:

- Was collaboratively developed. Interested parties, Federal, State, City, and County agencies within the Unit have been consulted and are listed in the plan.
- Identifies and prioritizes pre fire and post fire management strategies and tactics meant to reduce the loss of values at risk within the Unit.
- Is intended for use as a planning and assessment tool only. It is the responsibility of those implementing the projects to ensure that all environmental compliance and permitting processes are met as necessary.

EXECUTIVE SUMMARY

The California Department of Forestry and Fire Protection (CAL FIRE), Sonoma-Lake-Napa Unit (LNU) serves the counties of Sonoma, Lake, Napa, Solano, Yolo, and Colusa.

The LNU Fire Management Plan is a product of the implementation of the State Fire Plan. The State Fire Plan provides an analysis procedure to assess fire fuel hazards and risks in order to design and implement mitigating activities. The LNU Fire Management Plan provides background information, fuels and fire data, proposed projects, and individual Battalion reports outlining mitigating activities commonly carried out each year. This Plan is a local road map for the fire service and the public to create and maintain defensible landscapes to protect those assets vital to the state and its citizens.

Fire has shaped ecosystems throughout time; people and ecosystems have evolved with the presence of fire. However, for many years fire has been aggressively excluded to protect both public and private investments and to prevent what is considered the destruction of wildlands. This has resulted in a build-up of hazardous fire fuels as well as increased amounts of people and property dispersed through the wildlands.

The LNU Fire Plan outlines a comprehensive program designed to reduce total government costs and citizen losses from wildland fire in the Unit. It also strives to assist the public with assistance and education to create fire adapted communities that can more safely withstand a wildland fire. To accomplish this, CAL FIRE continues to implement this plan to address such factors as:

Firefighter and Public Safety, Hazardous Fuel Treatment, Fire Suppression, Information/Education, Inter-agency Cooperation
Priorities

1. Public road escape routes
2. Community Fuel Breaks
3. Landscape level fuel reduction and ridge top fuel breaks.

Throughout the process, the plan must:

- Consider and incorporate the cooperative interdependent relationships of wildland fire protection providers
- Provide for public stakeholder involvement
- Maintain accountability and responsibility of expenditures for activities and assets

Furthermore, the Sonoma-Lake-Napa Unit Fire Plan will develop and foster partnerships to gain concurrence on plan implementation.

Key Objectives

Establish any relationships, partnerships and councils necessary to reduce wildfire risks and losses by emphasizing community-level resources and solutions. Leverage partners with common interests/or motivations.

Develop and sustain a portfolio of high-impact, least-cost, stakeholder-driven solutions for reducing wildfire risks and losses by creating and sustaining new solutions, eliminating low-impact solutions and streamlining high-cost solutions.

Develop the Fire Plan, using the key elements identified by CAL FIRE and supporting smaller communities with the development of their local Community Wildfire Protection Plan (CWPP)

Engage collaborative partners to lead and drive the effort to protect communities from wildfire. The CAL FIRE role is transitioned into a support-oriented role, focusing primarily on active participation, facilitation and evaluation of program results.

Ensure the community understands, accepts responsibility and takes necessary action to mitigate wildfire risk, thereby preventing lives and property from being lost or damaged in wildfires.

SECTION I: UNIT OVERVIEW

A: UNIT DESCRIPTION

The Sonoma-Lake-Napa Unit (LNU) is one of twenty one (21) California Department of Forestry and Fire Protection (CAL FIRE) administrative units. The Unit was created in 1996 when the Sonoma Ranger Unit and the Lake-Napa Ranger Unit were merged into one unit. LNU has primary responsibility for more than 2.3 million acres of CAL FIRE Direct Protection Area (DPA) lands, more than any other unit. It has the third largest population living within CAL FIRE DPA, and ranks the third in average number of annual fires.

The Unit is divided into five divisions and ten field battalions. The boundaries of Sonoma County define the West Division, and are comprised of four field battalions. Napa County defines the South Division, and is comprised of three field battalions. Lake County defines the North Division, and comprised of two field battalions. The remaining counties of Yolo, Solano, and Colusa define the East Division, and are comprised of a single battalion.

The Unit has The Mendocino National Forest as a boundary to the north, the Pacific Ocean to the west, the San Francisco Bay to our south, and the Sacramento Valley to the east.

Sonoma-Lake Napa Unit's Headquarters, including the Emergency Command Center (ECC) and the South Division offices are located just north of St. Helena in Napa County. Division specific offices are located in smaller facilities; Santa Rosa Station for the West Division, Konocti Camp for the North Division, and Delta Camp for the East Division.

The predominant fuel types in the Sonoma-Lake-Napa Unit are grass/oak woodland to decadent chaparral, with mixed conifer forests.

Elevation with the Sonoma-Lake-Napa Unit ranges from sea level to 7000 feet on the Mendocino National Forest. The topography includes long valleys and ridges running North/South. Steep slopes and drainages significantly hinder firefighting efforts. Disked vineyards, crops, roads and other manmade features provide a limited network of barriers that assist firefighting efforts.

A significant numbers of the unit's large and damaging fire history has occurred along the Highway 16 corridor through Rumsey Canyon. Because of poor access, steep slopes and strong north winds, these fires have burned up to 30,000 acres. Most of the Lake County has been burned by large fires in the last several decades. The largest known fire was the human caused Fork Fire that started in Middle Creek on the border of the Mendocino National Forest just North of Uppelake. The fire burned more than 83,000 acres of brush and timber in 1996. Previous to the Fork Fire was the Mendenhall Fire, which also started on the Mendocino National Forest by lightning and burned nearly 67,000 acres. Past fire history in Sonoma County has occurred on the Eastern side of the Santa Rosa Plain. These consist of major fires approximately every 10-12 years mostly occurring in the Geysers area consisting of 10,000-12,000 acres. The Hanley Fire started on Mt. St Helena in Napa County and burned all the way to Santa Rosa.

The Sonoma-Lake-Napa Unit consists of high, medium, and low priority landscapes per the California's Forests and Rangelands: 2010 Assessment.

The overall goal of this plan is to reduce the total costs and losses from a wildland fire through focused pre-fire management prescriptions and increase initial attack fire success.

B: UNIT PREPAREDNESS AND FIREFIGHTING CAPABILITIES

CAL FIRE Facilities

During peak fire season the Sonoma-Lake Napa Unit staffs 20 schedule B stations that house 31 wildland (ICS type III) engines and six bulldozers, one Helitack base (Copter 104), one air attack base with an air attack (Air Attack 140) and two air tankers, two Conservation Camps with California Department of Corrections and Rehabilitation (CDCR) inmates comprised of 11 person hand crews.

The Unit has five Divisions: North, South, East, West and Central.

The North Division (Lake County) is comprised of three State Fire Stations (Middletown, Kelsey Cobb and Clearlake Oaks Station), that house 6 engines and 2 dozers, Boggs Mountain Helitack (Copter 104), and Konocti Conservation Camp (5 crews). In addition to the state facilities CAL FIRE has Schedule "A" contract with South Lake County Fire District that includes dispatching and paramedic services.

The South Division (Napa County) is comprised of 5 State and 2 County (Schedule "A") Fire Stations (St. Helena, Las Posadas, Spanish Flat, Gordon Valley, Napa, Greenwood Ranch and Yountville Station) which house 8 Schedule "B" engines, 1 dozer, 4 Schedule "A" engines and a Schedule "A" truck. There is a Schedule "A" contract at Napa, Greenwood Ranch, Yountville and St. Helena Stations and "Amador" contracts at Napa, Spanish Flat and Gordon Valley Stations. Napa County Fire Department is also administratively run by Cal Fire and oversees nine volunteer departments.

The East Division (Colusa, Yolo and Solano Counties) is comprised of three State Fire Stations (Leesville, Wilbur Springs, and Brooks Station's) that house 3 engines and Delta Conservation Camp with 6 crews.

The West Division (Sonoma County) is comprised of Sonoma Air Attack Base (Air Attack 140, Air Tankers 85 and 86), and 9 State Fire Stations (Santa Rosa, Occidental, The Sea Ranch, Cazadero, Hilton, Glen Ellen, Petaluma, Healdsburg, and Cloverdale Station, that house 14 engines and 2 dozers. The Sea Ranch contracts with CAL FIRE for Schedule "A" services, both Petaluma and Hilton Stations have an "Amador" contract through Sonoma County. Cal Fire dispatches for the City of Cloverdale

The Central Division (Napa County) is comprised of the administrative duties for the Emergency Command Center, Service Center, Training Bureau and the Safety Battalion Chief.

WHY INTER-AGENCY COOPERATION IS ESSENTIAL

Fire as a process involves the proper combination of three elements: heat, oxygen, and fuel. A wildfire doesn't conform to jurisdictional boundaries. It burns wherever the three elements are present. Therefore, a wildfire, regardless of size, can impact a wide variety of stakeholders. A stakeholder can be any person, agency, or organization with a particular interest in fire safety and protection of assets from wildland fire. In LNU this includes, but isn't limited to, the fire protection

professionals from more than 100 paid and volunteer fire departments, nearly one hundred active Volunteers-in-Prevention (VIP), planning staffs from the six counties, air quality staff from five separate air quality districts, and dozens of citizens groups, both formal and ad-hoc, that have engaged the issue of fire protection in their respective communities. LNU recognizes that such engagement takes many approaches. The stakeholders have taught us there is no such thing as a single "standard approach" to reducing costs and losses due to wildfire.

In some instances, concerned citizens have formed exclusively around the issue of fire, in which case they are known as "fire safe councils." In LNU, such councils have been formed at various levels of community

and governance. For example, Fire Safe Sonoma encompasses the entire County of Sonoma, while the South Lake Fire Safe Council encompasses a portion of Lake County that has a common tradition resulting from a geographically influenced fire history and a fire protection district that evolved in response. At an even more refined level, the Mt. Veeder Fire Safe Council in Napa County is oriented toward a specific community with its' own unique fire safety concerns. In addition to work in coordination with the countywide Napa Community Firewise Foundation.

In other instances, long-established community groups are considered functionally equivalent to fire safe councils. Examples include the Hidden Valley Lake Homeowners Association in Lake County, the Berryessa Estate Homeowners Association and the Circle Oaks Homeowners Association in Napa County, and the Fountain Grove Open Space Maintenance Association and the Fitch Mountain Neighborhood Association in Sonoma County, all of which have worked for years with local CAL FIRE representatives to implement community defense wildfire protection projects. Neighborhood and homeowner groups like these have been in existence for many years and have a long history of addressing common problems of local land use and development, watershed issues, and other local community environmental concerns.

Typical The Sea Ranch Structure and Landscaping

On the northern Sonoma Coast, The Sea Ranch has its' own fire management plan dating back to the 1980s aimed at increasing community wildfire

awareness and the implementation of a combination of fuel breaks and fuel reduction to protect assets, mainly structures, at risk. Dealing with the challenges posed by wildfire is often consistent with these longstanding local approaches.

Other local stakeholders include public and private institutions, such as Pacific Union College, St. Helena Hospital and Health Center, and the California Veterans Home, all in Napa County; the Audubon Society in Yolo County; the Cal Pine Energy Corporation and the Northern California Power Authority, both geothermal energy producers in the Geysers area of Sonoma and Lake Counties; Pacific Gas & Electric, and numerous Resource Conservation Districts throughout the six county area. Unit staff has long worked with every one of these institutions to implement pre-fire management projects of various types.

Various local, state, and federal government agencies also have major stakes in fire safety and protection of assets from wildland fire. At the federal level, LNU has worked closely with the USDI Bureau of Land Management's (BLM) Ukiah Field Office, USDA Forest Service's (USFS)

U.S. Army Corps Lake Sonoma Prescribed Burn.

Mendocino National Forest, and the U.S. Army Corps of Engineers on numerous pre-fire management projects over the years. State agencies include the Department of Fish and Game, State Lands Commission, and the Department of Parks and Recreation. The Unit currently has either active or recently completed Vegetation Management Program (VMP) projects on lands administered by each of these agencies.

The Unit works closely with more than 100 volunteer and paid fire departments. In Napa County, the unit

fulfills a dual function as the Napa County Fire Department. The Unit is partnered with the county fire and planning departments of Napa and Sonoma Counties in co-sponsorship of a regional Fire Wise Community Workshop that engaged many of the stakeholders mentioned above in the unit's fire management planning process. This process continues today as the Napa Communities Firewise Foundation, which has the full endorsement of the Napa County Board of Supervisors. This countywide program continues to receive federal wildland urban interface (WUI) grant funding as well as county funding. Over and over again, the key issue that arises in all these forums is the growing WUI problem and the related problem of decreasing availability and affordability of homeowner's insurance.

A second key issue in the unit is the unique class of assets at risk in the Geysers geothermal field. Here, capital improvements that are valued in excess of four billion dollars are vulnerable to some of the heaviest wildland fuel loadings in the unit. Not only are these facilities at risk to wildfire, they also pose the risk of ignition to themselves. This is due to numerous high-voltage transmission lines associated with the power plants that generate and deliver electricity to Californians daily.

St. Helena City Fire Department	Fire Chief
The Sea Ranch Fire Protection District	Fire Chief
Wilmar Fire Protection District	Fire Chief
Napa County Airport	Airport Administrator
BLM	BLM Representative
USFS	USFS Representative

SECTION III: VALUES AT RISK

A: IDENTIFICATION OF ASSETS AT RISK

The primary purpose of wildland fire protection is to safeguard the wide range of assets that can be threatened by wildfire. Assets at risk refer to values that have the potential to be burned or damaged by wildfire. In LNU, these assets include life and safety, structures, water and watershed values, agriculture, rangeland, recreation, air quality, soil resources, wildlife, unique scenic areas, cultural and historic resources. Among the unit's assets at risk are some of the world's most valuable agricultural lands, which are often interspersed with high-value real estate, both residential and commercial. Sixteen assets have been identified by the Statewide Assessment and ranked as to their risk from wildfire.

The resident population within the unit is more than 1.2 million. Suburban populations are booming in the southern end of the unit, particularly in Solano County, along the Interstate 80 corridor that links San Francisco and Sacramento. As available Local Responsibility Area (LRA) lands are used for residential, industrial and agricultural purposes, there is increasing pressure for development in SRA lands. Accelerated growth is occurring in the population centers of Santa Rosa, Petaluma, Windsor, Healdsburg, Cloverdale, Vacaville, Fairfield, Vallejo, and Lake County. All of these areas are characterized by a growing wildland urban interface (WUI) fire problem.

More than an estimated five million tourists travel through the unit each year, taking part in a wide variety of recreational activities from wine tasting to enjoying the waterways.

The Geysers geothermal field, which is located in the Clearlake Volcanic Area straddling Sonoma and Lake Counties, is a unique asset at risk, and one that plays a large role in the unit's wildfire protection planning. The complex is comprised of dozens of high value structures, including 22 power generating plants scattered over 30,000 acres of remote, steep, and broken topography of the Mayacamas Mountains. This geothermal field is the largest and most productive in the world. It has an estimated electrical generating capacity of over 2,000 megawatts and supplies power to over one million California residents. More than four billion dollars in capital improvements is at risk to wildfire in the midst of some of the unit's most high hazard wildland fuels. The numerous power-generating activities are not only at risk to wildfire, but also have periodically been sources of ignition.

B: COMMUNITIES AT RISK

Sonoma County:

Agua Caliente	Annapolis	Asti	Bennett Valley
Bloomfield Camp	Bodega	Bodega Bay	Boyes Hot Spring
MeekerDuncan	Cazadero	Cloverdale	Cotati Forestville
Mills Geyserville	El Verano	Eldridge	Guerneville

West Sacramento	Winters		

Solano County:

Benicia Vallejo	Fairfield	Green Valley Estates	Vacaville
-----------------	-----------	----------------------	-----------

SECTION IV: PRE FIRE MANAGEMENT STRATEGIES

A: FIRE PREVENTION

Goals

The primary goal of the unit's Prevention Bureau is to limit the number of negligently caused fires. Through training and experience we will increase company officer investigations to reduce the amount of undetermined fires reported in the unit. The Fire Prevention Bureau will work closely with adjoining agencies to limit linkage blindness for serial arsonist activity.

Objectives

Build on and introduce new public information avenues focusing on LNU cause specific information to prevent ignitions i.e. equipment and debris burning.

Bi-lateral law enforcement and civil cost recovery levied on electrical utilities to encourage proper conductor maintenance thereby reducing ignitions.

By continuing to work towards all company officers being trained to the NWCG FI-210 standard, fewer wildland fires should be undetermined for a final cause allowing for even more accurate ignition problem identification for LNU.

Maintain memberships on Fire Investigation Task Forces within LNU to network with other agency investigators and to share intelligence on possible serial arson activity.

The ultimate goal is to reduce the number of ignitions.

The primary cause for fires within the Sonoma-Lake-Napa Unit is human related.

Total Fires by Cause: LNU 2016

ENGINEERING & STRUCTURE IGNITABILITY

One incomplete aspect of the previously discussed vegetative wildfire fuels analysis is the consideration of structures located within the wildland areas. To a wildfire, a structure is just another fuel. And as mentioned before, the only element of the three environmental elements that influence the behavior of wildfire that we, as humans, can change is fuel. If a structure is in the planning stages, design and construction material recommendations can be made to make the structure less prone to ignition by wildfire. However, if the structure is already built, the easiest factor to change may be to implement various fuel modifications around the structures in order to protect them from encroaching wildfires. Public Resources Code (PRC) 4291 addresses fuel modification and the concept of “defensible space.” Defensible space can both be thought of for protecting a structure and also providing firefighters with a safe environment to position their fire apparatus and perform the necessary function to prevent the structure from igniting. Unfortunately, the proper building construction and defensible space cannot guarantee that the structure will survive all wildfire possibilities.

Development in Hazardous Areas

Development in the wildland urban interface provides for a myriad of issues that must be and are addressed through development standards and land use planning. Land use planning must recognize the hazards and treat them as constraints in the planning process.

Communities plan to minimize these fire hazards by requiring elevated development standards within especially vulnerable areas. These standards include the requirement for fire resistive construction materials, development of adequate emergency access routes, access to fire suppression water supplies (fire hydrants or water tanks), and defensible space around structures. The implementation of these standards helps minimize, but not entirely eliminate the hazards and damage from wildland fires.

Staff actively reviews and comments on General Plan safety elements proposed by the various counties within the unit, and works with the counties on Fire Safe ordinances or partnerships in regards to Public Resource Code 4290.

Wildland Urban Concerns

Example of good address signing

Example of poor road signing

Example of poor, overgrown road access

Example of fire protection water storage

Example of locked gate access

Example of poor overgrown access

INFORMATION AND EDUCATION

The Sonoma-Lake-Napa Unit is very engaged in public information and education activities. The Unit is asked to report their monthly prevention activities. Doing so gives us a clear picture of activity in the field with regards to public information and education. The Sonoma-Lake-Napa Unit dedicates an impressive amount of personnel hours towards information and education. These efforts are reported to the region monthly and reflected well on the unit. The Unit participates annually in over 2,000 hours of public education activities, making an estimated 41,500 public contacts.

Every contact with a member of the public is an opportunity to educate. The importance of fire safety, whether the message is defensible space, exit drills in the home (E.D.I.T.H), changing smoke detector batteries, or dialing 9-1-1; these messages must be delivered to the public whenever possible.

Beginning in 2011 Unit personnel and a hand full of Volunteers-In-Prevention were instrumental in creating the Sonoma County Safety PALS troupe whose mission is to educate the youth of Sonoma County in life safety and fire prevention skills. This theatrical troupe is made up of multiple public agency personnel with a common goal to provide outreach to the youth of the community. Each year the Sonoma County Safety PALS will educate kindergarten through third graders with their fun and engaging life safety performances, twice a year, at different locations throughout the county.

Preventwildfireca.org is a multiagency fire prevention website with a focus on reducing wildfire ignitions. Readyforwildfire.org is the website that carries the department's defensible space message. Everyone should be aware of this website and its benefits for educating the public on defensible space and general fire resistive building construction.

For the rural landowner, the unit has created a defensible space mailer, to be delivered to an entire community, which provides information on creating and maintaining a defensible space around their structures. The information mailer also includes: creating a wildfire action plan, a self-check-off list which directs the homeowner to focus on structure/property requirements to meet the State mandatory *Public Resource Code 4291* (defensible space around structures) and information to contact your nearest CAL FIRE station for additional information or education. CAL FIRE uses an internal form referred to as "LE-100" (Law Enforcement form #100) to complete PRC 4291 defensible space inspections. Common terminology for CAL FIRE personnel is "LE-100 inspections" or "defensible space" inspections.

Additional information regarding defensible space, PRC 4291, and local ordinances is available at CAL FIRE facilities and CAL FIRE's website (www.fire.ca.gov).

The Sonoma-Lake-Napa Unit is situated a major media market. This gives our Unit additional opportunities to deliver our fire prevention messages. By placing road signs in high traffic areas, and increasing our personal interaction, we are able to serve the message to a large amount of the general population. The fire service makes contact with people on the worst day of their lives, what we teach them about fire safety can reduce the impact of that worst day, or help avoid it entirely.

B: VEGETATION TREATMENT

The Vegetation Management Program (VMP) is a cost-sharing program that focuses on the use of prescribed fire, and mechanical means, for addressing wildland fire fuel hazards and other resource management issues on State Responsibility Area (SRA) lands. The use of prescribed fire mimics natural processes, restores fire to its historic role in wildland ecosystems, and provides significant fire hazard reduction benefits that enhance public and firefighter safety.

FUEL TREATMENT

LNU is actively conducting several fuel treatment projects throughout the unit. These consist mostly of shaded fuel breaks in areas identified in the communities at risk section of this plan (these areas are also identified in appendix A "High Priority Pre Fire Projects").

LNU Fuel Treatment Priorities

1. Ingress and Egress Enhancement of Public Roads with Shaded Fuel Breaks and Fuel Reduction.
2. Strategic Community Fuel Breaks.
3. Broadcast Prescribed Fires.

SUPPRESSION REPAIR

After a damaging wildland fire the unit will take every measure to assure the act of wildland fire suppression repair is completed. The objective of wildland fire suppression repair is to provide for prompt action following wildfire and associated fire suppression activities to minimize, to the extent practical:

1. Loss of soil and on-site productivity.
2. Discourage the spread of noxious weeds.
3. Deterioration of water quality and adverse change in runoff characteristics.

FOREST AND RANGE HEALTH

Unique to LNU, there are two State Forests managed by the Department on behalf of the public. Boggs Mountain Demonstration State Forest (BMDSF) is a 3,493-acre mixed conifer forest located in Lake County and Las Posadas Demonstration State Forest (LPDSF) is a 796-acre mixed conifer forest located in Napa County, which also incorporates the most eastern stand of redwood in California.

State Forests are working landscapes that are mandated to conduct research, demonstration, and education on sustainable forestry practices using active forest management, including periodic timber harvests. Management of the State Forests is required to protect values relating to recreation, watershed, wildlife, range and forage, fisheries, and aesthetic enjoyment. The concept of forest sustainability includes the restoration and protection of forest ecosystems, both terrestrial and aquatic. Important issues include stewardship of managed forestlands to restore and maintain biodiversity and ecosystem functions thereby providing healthy forest and rangelands. Timber harvesting also significantly reduces the amount of fuel continuity on the State Forests through the removal of snags, providing shaded fuel breaks, burning slash debris, and restoring road systems to enable better egress and ingress for fire equipment and personnel.

The objectives of such forest management practices include enhanced protection from wildfire impacts on the forestland resource and the developed interface lands of the rural residential communities adjacent to and near State Forest property. These objectives are accomplished through the reduction of flashy fuels, fuel accumulations, and fuel ladders that foster crown fires. The prescribed burning that occurs on the State Forests reduce ground fuels, reduce overgrown brush, and thin the understory to reduce vertical and horizontal continuity of fuels while protecting over story conifers and hardwoods. The benefits of these low intensity fires include reducing the accumulation of hazardous fuels, enhancing wildlife habitat, control forest disease, provide new growth, and reducing the potential for catastrophic wildfires.

BMDSF has previously been managed as a working forest that facilitates research and demonstrates diverse timber management practices to private timberland owners and the public at large. Another long term objective is to once again have BMDSF provide for healthy sustainable ecosystems as well as become a financially viable timber management program. The Forest is managed over the long term for a dynamic mosaic of diverse habitats and high volume inventory. Following the Valley Fire, BMDSF has been closed to the public indefinitely due to the significant hazards created by the fire itself, as well as the resulting salvage logging operations.

In the summer of 2015 the Valley Fire burned 90 percent of the Boggs Mountain Demonstration Forest. The fire has resulted in a reduced wildfire threat to the forest property and surrounding property owners. As such, fuel reduction projects on BMDSF are no longer a primary management objective. Current management objectives have consisted of salvage logging, site prep, and reforestation. There has also been the initiation of research projects in current fields of concern including erosion and sedimentation impacts and stream channel migration. All of these objectives are focused on meeting the long term goal of restoring BMDSF to pre-fire conditions and reopening the forest for public recreation.

The Valley Fire burned approximately 3100 acres within BMDSF. Approximately 90 percent of the forests trees were killed or damaged during the fire. The dead trees have created hazardous conditions for visitors, firefighter personnel, and contracted personnel working within the forest. The forest has continuously been removing hazard trees since the fire's control date. BMDSF has 22 miles of unimproved roads available to civilians for recreational use. Roads have been repaired and improved so that fire and contracted personnel could remove trees during the rainy season. CAL FIRE Personnel contracted road grading equipment, crushed rock on site rock, had road base delivered, and installed new corrugated metal drainage pipes for road improvement.

LPDSF also provides for demonstration and research activities; however it is unique in the State Forest Program because merchantable timber harvesting is not allowed under the deed restriction and the Forest is not open to the public at large. Because of its diversity of terrain and ecosystem characteristics, the Forest provides for interesting research projects.

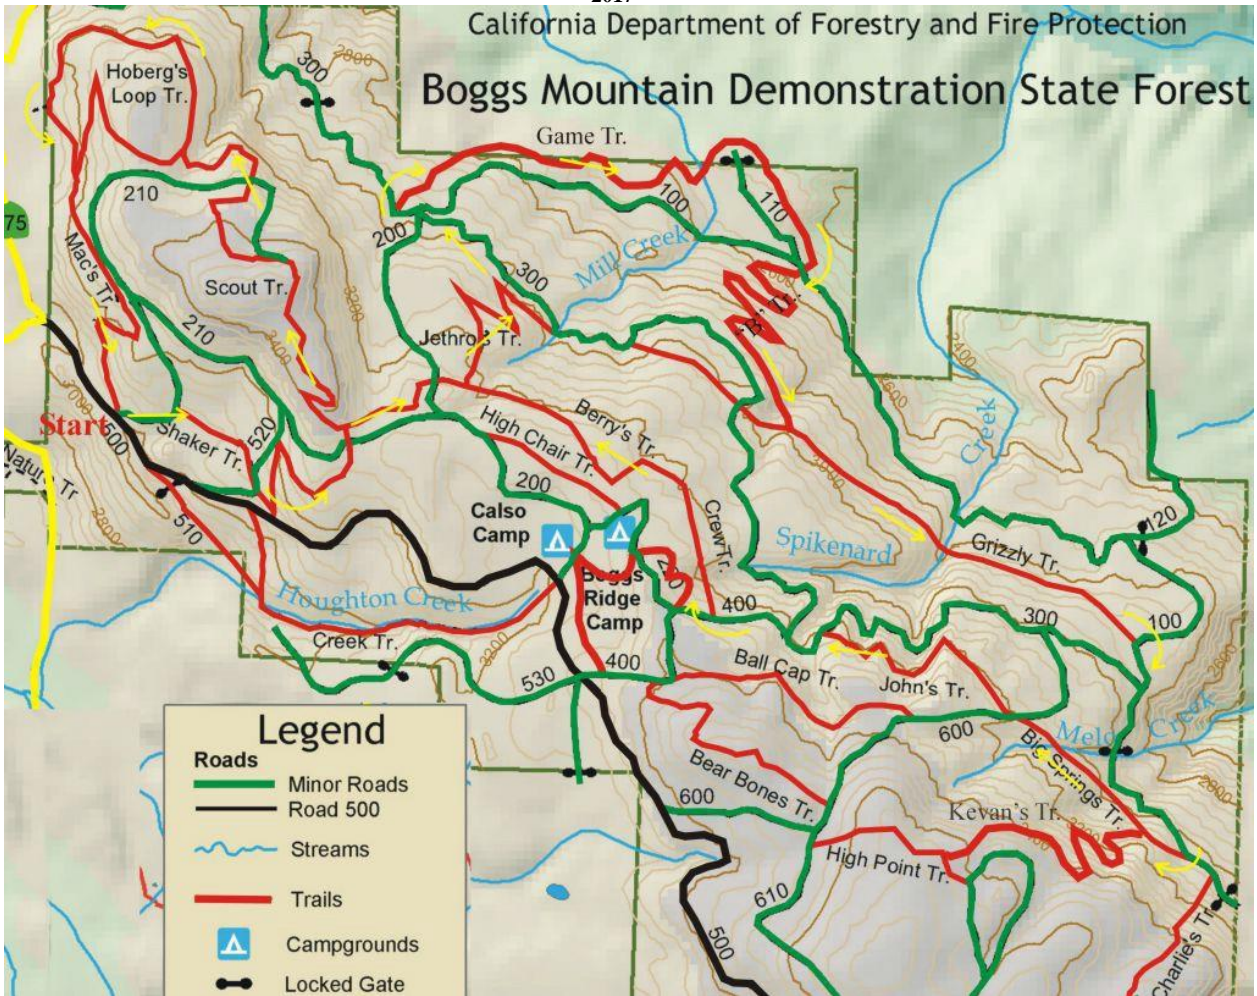

Fuel reduction projects are ongoing on LPDSF, and have been conducted on BMDSF in the past. Such projects include vegetation management, broadcast burning, pre-commercial thinning, and the removal of dead, dying, and diseased trees. Both LPDSF and unburned tree stands at BMDSF have been impacted by forest pests such as western pine beetles, flat-headed woodborers, and Annosus root disease. Treatment methods to reduce the brood

material are practiced on both State Forests, such as lopping and scattering slash or burning slash to reduce the population of pine beetles.

Outside of the State Forest Program, LNU is active in enforcing the Forest Practice Rules on private timberland where Timber Harvesting Plans (THPs) have been submitted. Most of the THP submitters are small non-industrial timberland managers and timber harvesting is common in Sonoma, Lake, and Napa Counties. While evaluating THPs in the field, the Forest Practice Inspector enforces the Public Resources Code and Forest Practice Rules, which provide protection for forest and rangelands. Such rules include provisions for the operation of fire causing equipment, use of hydrocarbon powered engines near forest, grass, or brush lands, and for the operation of chainsaws in the forest environment. The Forest Practice Rules provide specific protection to lakes and watercourses, wildlife, and plants through restrictions on silviculture methods, harvesting practices and erosion control, site preparation, hazard reduction, and fire protection.

Benefits from harvesting timber on private land are similar to those when harvesting timber on the State Forests, including the reduction of fuels, removing dead, dying or diseased trees, improving road networks, providing new growth by opening the stand to more sunlight, and controlling forest pests. A common forest disease found in Sonoma and Lake Counties is Sudden Oak Death. Many THPs are located within the Board of Forestry and Fire Protection Zone of Infestation. As a result, each THP must identify feasible measures to mitigate adverse impacts from the timber operation. The Forest Practice Inspector also enforces these measures. Treatments typically include inspection of equipment on the timber operation site, unprocessed saw logs do not leave the Zone of Infestation, and non-merchantable material remains on-site. Such measures also help reduce the potential for catastrophic wildfires.

The enforcement of the Forest Practice Rules and Public Resources Code on private timberlands and the active forest management on the two State Forests within LNU provide healthy forest ecosystems and rangelands found throughout the unit. Restoring and maintaining the sustainability of the natural resources is the goal of the CAL FIRE Resource Management Program. The Department achieves this goal by demonstrating sound management practices on the State Forests, enforcing the California Forest Practice Act on all non-federal timberlands, providing research and educational outreach to the public on forest pests and pathogens, such as the Bark Beetle and Sudden Oak Death, and coordinating efforts for reforestation and fuel reduction to reduce the risk of fire and improve the quality of California ecosystems.

Map of Boggs Mountain Trail System

SECTION V: PRE FIRE MANAGEMENT TACTICS

A: DIVISION / BATTALION / PROGRAM PLANS

Vegetation Management Program (VMP)/Pre-Fire Engineering Division

The Division works in close coordination with the Fire Prevention Bureau, Unit management staff, and other stakeholders to focus its' activities described below in the most effective means possible.

VMP

The goal of the Vegetation Management Program (VMP) is to reduce the chance of large, damaging wildfires by reducing fire hazards on wildlands in the unit. Encouraging the best 'mix' of natural resource benefits from these lands, consistent with environmental protection and landowner objectives, is the unit's intent. This includes the three broad purposes, which encompass most Vegetation Management objectives:

- Reduction of conflagration fires.
- Optimization of soil and water productivity.
- Protection and improvement of intrinsic ecosystem values.

Pre-Fire Engineering

Fire prevention engineering processes reduce or eliminate fire hazards and risks by changing the environment by:

- Removing or reducing the heat source
- Modifying or reducing the fuels
- Modifying the act or omission allowing the heat source to contact ignitable fuels.

The proper application of civil, mechanical, electrical, chemical and industrial engineering techniques can reduce the number of ignitions caused by hazardous conditions or operations. Also, fire prevention engineering combines ignition management and fire hazard and risk reduction through fuel modification, vegetation management and hazard reduction activities carried out by unit fire prevention staff, VMP staff, and fire control personnel. The unit fire prevention plan carries out many activities, including fire safe/land use planning and structure and premises inspection.

- Fire safe/land use planning minimizes the loss of life, structures, and resources from uncontrolled wild fires by incorporating minimum fire safety standards into all new development occurring in the SRA, creating defensible space around developments, and eliminating disastrous fuel build-ups thorough integration of fire safe/land use planning activities and the unit vegetation management projects.
 - The unit Pre-Fire Engineer works closely with county planners and CAL FIRE Region staff to provide for consistent application of SB 1241 and related regulations.
- Structure and premises inspection activities prevent fires originating in structures from spreading to forested areas and also minimize the chance of a forest fire entering into populated areas, destroying improved property, and endangering human life.
 - The Unit conducts LE-100 inspections on buildings in the SRA, in priority areas as designated by field Battalion Chiefs. These inspections coordinated by the VMP Division and are conducted by CALFIRE engine companies, Defensible Space Inspectors, and other cooperative fire agencies.

Program Priorities

- Fuel Treatment Projects
 - That Improve Public Access and Egress on Roads
 - That Provide Strategic Fuel Breaks near Communities
 - That Treat at the Landscape Level (Ridge Lines and Prescribed Fire)
- Unit Fire Plan
- SRA Review
- LE-100 Defensible Space Inspections
- Local Wildfire Predictive Services

Staff Assignments

Division Chief – Program Manager
Forester I – Environmental Review Coordinator
Fire Captain - Pre-Fire Engineer, GISS technical specialist
Fire Prevention Specialists FPS- (2) Information/Education
Forestry Aide – (4-6 Seasonal) Defensible Space Inspectors

Prevention Bureau

The Fire Prevention Bureau is involved in the broad spectrum of fire prevention activities in and outside of the unit. The Fire Prevention Bureau in conjunction with Volunteers in Prevention (VIP's) and other unit staff, participate in more than 2,000 hours of public education activities, contacting more than 41,500 people annually. Volunteers in Prevention and other unit personnel accomplish over 1,000 defensible space inspections, with approximately 60 violations reported annually. The Fire Prevention Bureau has taken an active role in the support of local Fire Safe Councils, partnering with them to standardize our defensible space and fire safety messages. The Fire Prevention Bureau is active in civil cost recovery at the unit level. The Fire Prevention Bureau has positive outcomes for civil cost recovery and law enforcement.

Training Bureau

The LNU Training Bureau administers the training programs for all personnel in the CAL FIRE Sonoma-Lake Napa Unit. The Unit Training Bureau coordinates both Unit training and Region training, administers JAC training, maintains training and DMV records, facilitates State Fire Marshal certifications and works cooperatively with numerous training agencies, colleges and neighboring departments.

Camp Program

Both Delta and Konocti Conservation Camps are actively involved in several fuels reduction projects within the unit. When not assigned to emergency response, these crews conduct labor-intensive work on critical hazard fuel reduction projects in support the unit fire plan.

Delta and Konocti Camps are actively engaged in SRA Fee funded fuel reduction projects in Sonoma, Lake, and Napa Counties. Delta Camp also works on fuels reduction projects in neighboring communities and the Santa Clara Unit (East Bay Regional Parks, with multiple locations of shaded fuel breaks). Thanks to the dramatic increase in the number of proposed fuel reduction projects, the demand for fire crews has increased and has spotlighted the need for more fire crews in the Sonoma Lake Napa Unit

DISTANCE CHALLENGES

Konocti and Delta Camps perform fuel reduction work in limited areas of Sonoma County, typically the eastern areas of the county. The burden of conservation camp work fell to these camps when Black Mountain Conservation Camp, located near Cazadero, CA, closed in 1992. All SRA areas west of Highway 101 are at least 1 hour, 30 minutes from any CAL FIRE camp, including Chamberlin Creek and Parlin Fork Camps of the Mendocino Unit. The high cost of diesel fuel, the poor fuel economy of our Emergency Crew Transports, and the limited available work window eliminates the utilization of CAL FIRE conservation crews as a cost-effective resource for fuel reduction work in most of Sonoma County.

AVAILABLE CREW CHALLENGES

When resources are not committed to emergency incidents, the unit has 11 fire crews between the two camps, with 5 assigned to Konocti Camp and 6 assigned to Delta Camp. Typically, there are only 200 days per year a fire crew is available to work, outside of weekends, holidays, and emergency incident commitments. Delta Camp usually commits 1 to 2 crews to the Santa Clara Unit for their fuel treatment activities, leaving 8 to 9 available crews for the 6 counties of the unit. This means that LNU can provide roughly 1,600 to 1,800 work days for various local projects. With over 60 fuel reduction projects proposed, with an average of 25 crew days required per project, it would take 1,500 work days to complete; this does not take into account current non-fuel reduction project commitments or previous projects requiring maintenance.

Because of the distance required to provide fire crews to Sonoma County, and due to the amount of fuel reduction work needed unit-wide, the unit has made a high priority to support the creation and funding of a third LNU fire camp, located somewhere in Sonoma County.

FUELS CREW

The unit recognizes that establishing a hand crew staffed with Firefighter 1's would be extremely advantageous to many of the Unit's needs. In the spring of 2016 & 17 two Fuels Crews were created in the Unit as part of the statewide Drought Augmentation. These two crews in a two-month period were able to complete over 100 acres of Fuel Reduction on various Shaded Fuels Break projects in the Unit. In the short time these crews were staffed, validated the needs for Fuels Crews in the unit meeting these three needs listed.

Need #1: Surge staffing of fire engines.

Fire season's beginning and end are no longer target dates, but blurred lines; it is no longer unusual to fight wildland fire in California during traditionally non-fire season times. When conditions dictate, as they did in late 2013, that it would be cost effective to hire Firefighter 1's due to the likelihood of an early and long fire season, the department had to go through the lengthy and burdensome hiring and training process, of which takes weeks, if not months, to complete. How easy would it be to transfer a Firefighter 1 fuels crew of 25 to fire engines in a moment's notice?

Need #2: Fuel reduction work in sensitive security areas.

Taking custody of and supervising inmates is a very serious responsibility. Although inmate fire crews can and do work around homes, schools, and other areas of concern, there are plenty of projects where it would make better sense to send a Firefighter 1 fuels crew to perform the required work. Currently, despite the written agreement of all shareholders, some of our projects are on hold because CDCR must physically sign forms that are sent via bus to Susanville Prison. A Firefighter 1 fuels crew would be able to handle these projects, and the inmate fire crew could switch to projects with less security requirements.

Need #3: Remote project work.

One of the limitations of inmate fire crews on projects is the reduction in available work hours on project corresponding directly with time travelled from camp; the further away from camp a project is, the less work will be performed each day, as crews leave camp at 9 am and must be returned by 5 pm. In theory, a Firefighter 1 fuels crew, with proper logistical support, could remotely work multiple days from an area CALFIRE station, to reduce the amount of days needed on project, thus being able to complete it sooner, and move to the next project earlier.

Because of the distance required to provide fire crews to Sonoma County, due to the amount of fuel reduction work needed unit-wide, and the advantages that using Firefighter 1's in a fire crew configuration brings, the unit has made a high priority to support the creation and funding of an LNU fuels crew, stationed at Santa Rosa station.

Fuels, Weather, Topography and Fire History per Division

North Division

Lake County

Fuels

There are a wide range of fuels in the North Division. Fuels range from Tule wetland and grass/oak woodland to decadent chaparral, to mixed conifer forests. The higher elevations are generally timbered while lower elevations tend to be chaparral or grassy oak woodland. Due to aggressive fire suppression tactics and lack of wildland fuels reduction, both the vertical arrangement and horizontal continuity of fuels will promote rapid fire growth. Where disked vineyards have been established in place of chaparral brush fields they can act as effective fuel breaks. Where vineyards have gone fallow, left untended, the fire will still spread through the vineyard. Critical concerns are when the chaparral dead-to-live ratio exceeds 50%, and live fuel moisture drops to near 60% in late summer and early Fall.

Weather

The weather is generally warm and dry during the day with good relative humidity recovery at night. Mid slope elevations may see poor humidity recovery due to inversions. Critical weather patterns are generally those that have higher temperatures and dryer conditions with poor nighttime humidity recovery such as North and East winds. When these conditions combine with the topography, expect extreme rates of spread, especially along exposed ridges and through constricted areas. Peak summer day temperatures generally range from 90-110 F, with relative humidity ranging between 10 – 25%. Temperatures and humidity moderate and winds tend to increase immediately adjacent to Clearlake. Gradient winds are generally out of the west or northwest at 5-10 mph,

Topography

Elevation with the North Division ranges from 1500 feet near lake level to peaks reaching 5000 to 7000 feet on the Mendocino National Forest. The topography consists of broad rounded trending ridges running North/South splitting around Clearlake. Slopes generally increase as you go from ridgeline to drainage bottom. Steep slopes, drainages and timber fuels can significantly hinder firefighting efforts. Vineyards, roads and other manmade features provide a limited network of barriers that assist firefighting efforts. Road access off of well-developed county roads can be sketchy at times with rough, narrow, often steep and rocky roads.

Fire History

Lake County has a significant fire history. Most of the county has been covered by large fire fires in the last several decades and beyond. Some of the recent fires have been the Clayton Fire that started on August 13th and burned more than 300 structures. The Valley Fire started on September 12th 2015 and burned 76,000 acres. It started on Cobb and burned downhill explosively with a strong NW wind behind it. 1,958 structures were destroyed (1280 residences, 27 multi-family, 66 commercial and 585 other), 4 civilian fatalities and 4 significant fire fighter burn injuries occurred. Earlier that same year the Rocky Fire burned 69,636 acres and destroyed 96 structures (43 residential and 53 other). The Rocky Fire started off Morgan Valley Road. Again, in 2015 the Jerusalem Fire burned 25,118 acres and destroyed 27 structures (6 residential and 21 other). The human caused Fork Fire that started in Middle Creek on the border of the Mendocino National Forest just North of Upper lake. The fire burned more than 83,000 acres of brush and timber in 1996. Before the Fork Fire was the Mendenhall Fire in 1986 which also started on the Mendocino National Forest by lightning and burned nearly 67,000 acres. These large fires and many others burned under relatively normal northwest flow conditions. Fires in the Geysers area have most recently burned under more extreme north and northeast wind conditions threatening power grid infrastructure. The eastern portion of the county is also greatly influenced by north and north east winds as the winds align with the topography on Walker ridge.

There is a Remote Automated Weather Station (Konocti RAWS) located at Konocti Conservation Camp. The station gives a good indication of current weather conditions. It can be accessed at <http://raws.wrh.noaa.gov/roman/>.

South Division

Napa County

Fuels

There are a wide range of fuels in the South Division. Fuels range from grass/oak woodland to 15 – 50 year-old chaparral, to redwood forests, to stands of decadent brush and timber over 50 years old. Due to fire suppression and lack of aggressive wildland fuels management, both the vertical arrangement and horizontal continuity of fuels will promote rapid fire growth. These same conditions will also hinder conventional fire suppression tactics. Vertical arrangement is conducive to passive (single tree torching), and active crown fires. Where vineyards have been established, if a “no-till” management approach (mandated on certain slopes) has been implemented, the fire will still spread through the vineyard. Critical concerns are when the chaparral dead-to-live ratio exceeds 50%, and live fuel moisture approaches 60% in late Summer and early Fall.

Weather

The weather is generally warm and dry during the day with good relative humidity recovery at night helped by the coastal onshore flow. Fog often returns to the area each night from the south, and dissipates by 11:00 am the following morning. If a critical weather pattern exists such as a Foehn North Wind, or a cold front passage, the daily diurnal weather variation will be subdued. When these critical weather patterns align with the topography, extreme fire behavior, especially along exposed ridges and through constricted areas is expected. Peak summer day temperatures are generally 80 – 90 degrees F, with relative humidity ranging between 20 – 35%. Gradient winds are generally out of the S/SW 5-10 mph, strengthening in the afternoon with a 10-15 mph wind in the late afternoon diminishing by dark. Upper elevations experience east winds in the early afternoon between 5 – 10 mph. Also, be aware of normal northwest winds (down slope/down valley) after dark as the flow reverses. There is a Remote Activated Weather Station (RAWS) for this area on the top of Atlas Peak Road approximately 1 mile west of Turtle Rock near Lake Berryessa. This site provides accurate conditions for the entire South Division.

Topography

Elevation with the South Division ranges from 0 – 80% slope with a two dominate north/south orientated ridges. Disked vineyards and other manmade features provide a network of barriers that will need to be connected to create an effective fireline. There are two main valleys within the South Division that can provide the opportunity for wind to be funneled even under local wind conditions; this situation will be compounded during critical weather conditions.

Fire History

Past fire history on the Western side of the Napa Valley (Dry Creek-Lakoya) is limited with major fires 40 – 70 years ago, burning well into Sonoma County within 1-3 days. The Eastern aspect slopes of the valley have not burned since the 1920s and fuels on the Western aspects are generally lighter and drier.

Past fire History on the Eastern side of the Napa Valley is limited with major fires 25-50 years ago burning along the Silverado Trail into Atlas Peak (Silverado Country Club) and from Monticello Road to Wild Horse Valley Road within 1-2 days.

In 1964 a major fire started on Mt. St Helena and burned to Santa Rosa. In the 1960's and again in 2008, fires occurred on and were generally held to, the western aspect between the communities of Angwin and Deer Park.

Recent large fire activity in the division includes the Butts Fire of 2014 and the Wragg Fire of 2015. Both fires started under “normal” summertime conditions and rapidly grew to major incidents within the first few hours. Ultimately, the Butts Fire consumed 4,300 acres and destroyed 2 residences while the Wragg Fire consumed 8,051 acres and destroyed 2 outbuildings

East Division

Colusa and Yolo Counties

Fuels

There are a wide range of fuels in the East Division. Fuels range from agricultural farmland (wheat, safflower, cut stubble), annual grasses, oak woodland, 15 – 50 year old chaparral, large stands of decadent brush and timber in the higher elevations of the battalion. Due to aggressive fire suppression tactics and lack of aggressive wildland fuels management, both the vertical arrangement and horizontal continuity of fuels, have and will promote rapid fire growth. These same conditions will also hinder conventional fire suppression tactics. Critical concerns are when the chaparral dead-to-live ratio exceeds 50%, and live fuel moisture approaches 60% in late Summer and early Fall. 10 hour fuel moistures average from 4-7, dropping to 3 quite often.

Weather

The weather is generally warm and dry during the day with a slight relative humidity recovery at night. If a critical weather pattern exists such as a Foehn North Wind, or a cold front passage, the daily diurnal weather variation will be subdued. If these critical weather patterns align with the topography, expect extreme rates of spread, especially along exposed ridges and through constricted areas. Peak summer day temperatures are generally 95°-105°F, cooling to 50°-60°F at night, with relative humidity ranging between 20% – 35% or less. Gradient winds are generally out of the N/NW 5-10 mph, strengthening in the afternoon with a 10-15 mph wind in the late afternoon diminishing by dark. Strong evening to early morning winds occur occasionally in the Capay Valley with normal winds (down slope/down valley) after dark as the flow reverses.

There is a Remote Automated Weather Station (Brooks RAWS) located at Brooks Fire Station. The station gives a good indication of current weather conditions. It can be accessed at <http://raws.wrh.noaa.gov/roman/>.

Topography

Elevation within the East Division ranges from 250' to 3000' with slopes ranging from 0 – 80%. There are two dominate North/South orientated ridges; Blue Ridge, running from the Yolo/Solano county line north to Rumsey Canyon and Walker Ridge, running from Hwy 20 to central Colusa county. These main ridges keep the coastal influence weather from being a factor. There are also two smaller ridges that can play a significant role to fire spread; Capay Hills and Cortina Ridge. Farmlands, ranches, rural and major roads along with other manmade features provide a network of barriers that will need to be connected to create an effective fire line. Capay Valley and Bear Valley are wide valleys that provide the opportunity for wind to be funneled even under local wind conditions; this situation will be compounded during critical weather conditions.

Fire History

There have been many large and destructive fires in the past in the East Division. Many of the fires have occurred along the Highway 16 corridor through Rumsey Canyon. Because of poor access, steep slopes and strong North winds, these fires have burned upwards of 40,000 acres. Other large fires have occurred along Walker Ridge. Past fires have also occurred along the Highway 20 and Highway 128 corridors.

Solano County

Fuels

There are a wide range of fuels in the Solano County area of LNU ranging from agricultural farmland, annual grasses, oak woodlands intermixed with chemise and coastal chaparral's in the western areas of the Vaca mountains to marshland tules in the East along the Sacramento river delta. Large areas of Solano county fall within the Mutual Threat Zone (MTZ) and offer the potential for structure protection issues if a fire were to start in these areas. Due to aggressive fire suppression efforts and lack of local wildland fuels management, both vertical and horizontal continuity of fuels will and have promoted rapid fire growth. Numerous Riparian zones are located throughout the county as well.

Weather

The weather is generally warm and dry with a great portion of the valley being marine influenced keeping areas to the south west seasonally cooler. With average day time temps ranging from 85 – 105 degrees in the summer, night time lows average to between 50-60 degrees with the marine influence comes a lot of fog which can and does influence temperature dramatically. Daily winds known locally as the Delta breeze range from 5-15 mph from the west act as a cooling effect throughout the south west increasing fuel moisture and recoveries. The area is also subject to Foehn North winds which range in speed from 25- 75 MPH with these winds expect high rates of spread and control problems.

Topography

Elevations within Solano County range from 21' ASL – 2818' ASL (Mt. Vaca) slopes range from 0% - 80%+. There is one prominent North/South ridge located within the Vaca mountains known as Blue Ridge running from Yolo/Solano counties. There are two topographic features of note within the county, Mt. Vaca and the Montezuma hills. There are numerous ridges located within these areas which influence the landscape dramatically and can and will contribute to fire spread. Narrow canyons and valleys with heavy fuel loading with numerous narrow man made roads offer several control issues, but do offer points to consider as control lines.

Fire History

Solano County does have a history of large wildland fires two of note are the 1965 Kaiser Fire when a fire started in the drought dried seasonal grasses and spread rapidly from Soscol Ridge off Hwy 29 to American Canyon. Reaching a final acreage of 25, 888 the other was the Mix Canyon Fire which reached an approximate 35,000 acres. The fire period of note was in 1965 which was referred to as black Thursday in which the county was under siege from the east to the west with several fires burning at the same time the largest becoming the above noted Kaiser Fire and a portion of the 2015 Wragg Fire.

West Division

Sonoma County

Fuels

There are a wide range of fuels in the West Division. Approximately the southern 1/3 of the county is grass or oak/woodland, and areas adjacent to the Napa/Sonoma and Lake/Sonoma county lines are known to be cone and chaparral. The coastal strip from Bodega north, inland to Graton and Forestville is conifer forests. Fuels range from coastal grasses along the coast to grass/oak woodland to 15 – 50 year old chaparral, to redwood/douglas fir forests, to stands of decadent brush and timber over 50 years old. Sonoma County does have stands of sudden oak death. Due to fire suppression and lack of aggressive wildland fuels management, both the vertical arrangement and horizontal continuity of fuels will promote rapid fire growth. These same conditions will also hinder conventional fire suppression tactics. Vertical arrangement is conducive to passive (single tree torching), and active crown fires. Where vineyards have been established, if a “no-till” management approach has been implemented, the fire will still spread through the vineyard. Critical concerns are when the chaparral dead-to-live ratio exceeds 50%, and live fuel moisture approaches 60% in late summer and early fall.

Weather

The weather is generally warm and dry during the day with good relative humidity recovery at night helped by the coastal onshore flow. Fog often returns to the area each night from the south, and dissipates by 11:00 am the following morning. The fog layer depth is between 1,000 and 1,500 feet, so elevations above this do not experience fog. If a critical weather pattern exists such as a North Wind, or a cold front passage, the daily diurnal weather variation will be subdued. If these critical weather patterns align with the topography, expect extreme rates of spread, especially along exposed ridges and through constricted areas. Peak summer day temperatures are generally 80 – 100 F, with relative humidity ranging between 20 – 35%. Gradient winds are generally out of the S/SW 5-10 mph, strengthening in the afternoon with a 10-15 mph wind in the late afternoon diminishing by dark. Upper elevations experience East winds in the early afternoon between 5 – 10 mph. Also, be aware of normal Northwest winds (downslope/down valley) after dark as the flow reverses. There is a Remote Activated Weather Station (RAWS) located in the NE corner of the Division in the “Geysers” area and in the Santa Rosa plain. These sites provide accurate conditions for the interior of the West Division. There is also a private lookout (Pole Mountain) located midway along the coast between Mendocino and Marin counties. Their weather observations help fill in the coastal strip area for fire weather for the West Division.

Topography

Elevation within the West Division ranges from sea level – 4,500 feet. Slopes range from 0-80% throughout the Division. Vineyards and other manmade features provide a network of barriers that will need to be connected to create an effective fireline. In the western and northwestern portions of the county there are not a lot of barriers. There is one main valley within the West Division that can provide the opportunity for wind to be funneled even under local wind conditions; this situation will be compounded during critical weather conditions.

Fire History

Past fire history on the Western side of the Santa Rosa Plain is limited with major fires 30 – 70 years ago in connection to the logging industry and more individuals being in the woods. Past fire History on the Eastern side of the Santa Rosa Plain consists of major fires approximately every 10-12 years mostly occurring in the Geysers area consisting of 10,000-12,000 acres. There have been major fires in the Sonoma area also, although to a lesser degree. In 1964 the Hanley Fire (52,000 acres) started on Mt. St Helena and burned in to the Santa Rosa area. Most of the significant fires have burned under critical fire weather conditions (North winds), but the possibility exists for a fuels and topography influenced fire to occur in the late summer and fall periods. The West Division does experience a few lightning caused fires every 3 - 5 years.

Battalion 1410 Santa Rosa (West Division)

Battalion 1410 spans the center of Sonoma county running from Bodega Bay to the top Mt St Helena. The battalion is characterized by Local Responsibility Area (LRA) in the Santa Rosa plain, with State Responsibility Area (SRA) on both sides. There are many local government fire departments and the largest city in the unit, Santa Rosa, is located within the battalion. There are three CAL FIRE engines, two at Santa Rosa and one at Occidental stations.

Every wildfire incident is a multi-agency cooperative effort and often involves structures being threatened. The perimeter of the 1964 Hanley fire, when placed over the Santa Rosa city limits and adjacent areas, encompasses over 1,000 structures.

Past Projects

The West Sonoma Fire Safe Council, which helps the rural area of western Sonoma County surrounding the community of Occidental, has provided a “free” chipper with operator to residents who cleared vegetation around their residence. Previously, chipping has been done on Joy Road. Battalion 1410 continues to work with the Foothill Homeowners’ Association to help them understand the risk of fire and the importance of defensible space, and advised on areas for fuels reduction and evacuation/refuge.

Current Projects

Battalion 1410 personnel are working with local government fire agencies and community groups on defensible space projects in conjunction with LE-100 inspections in the SRA. Staff are currently working with Santa Rosa City FD and Rincon Valley FPD on structure protection preplans for the Riebli Rd, Fountain Grove area. Cal Fire is assisting Pepperwood Preserve on long term fuels modification research in the Mark West watershed. Additional projects include the development of Community Wildfire Prevention Plans (CWPP) in the Ferguson Rd and St Helena Rd/Alpine Rd communities.

Annually, each Battalion within Sonoma County targets 100-200 residences per year for Mailers, followed up by defensible space inspections. Within Battalion 1410 target areas include Joy Rd in the Occidental area, and the SRA of the Mark West watershed. The primary threat to these intermix areas is a fire-under the influence of North winds which could immediately threaten hundreds of lives and residences. Additional concern includes the users of Foothill and Shiloh Ridge Regional Parks during a wildland fire event.

Future Projects and Priority Rankings

Future projects include areas identified as high risk/high hazard, support of the West Sonoma Fire Safe Council, fostering development of CWPP's with Fire Safe Sonoma, and cooperative efforts with the City of Santa Rosa in the Fountain Grove area. Next priority for the LE-100 program are the Foothill Ranch and Reibli/Wallace areas.

Total Fires by Cause: Battalion 10

Battalion 1411 Russian River (West Division)

Battalion 1411, the Russian River Battalion, encompasses the northern Sonoma County coast from Mendocino County to just south of the Russian River, and inland to the Guerneville community. The entire Battalion, approximately 245,000 acres is all CAL FIRE Direct Protection Area, with all being State Responsibility Area except for several small areas of Bureau of Land Management ownership and the Stewarts Point Rancheria lands. The dominant fuel model is Mixed Conifer (Light), but fuels range from Coastal prairies to old growth Redwood and chaparral to small pine plantations.

Most of the Battalion can be considered remote, as areas away from Highways 1 and 116, and county roads, can be difficult to access because of fire roads that have not been maintained, bridges that cannot support fire apparatus, steep topography, and lack of road signs and posted addresses. Fire suppression resources are not familiar with the road network, local landmarks, and fire environment because there have not been frequent large and damaging wildfires. This road network will hinder emergency response as well as evacuation of the Public.

Battalion 1411 is comprised of three State funded fire stations.

- Hilton Station (2 fire engines)
- Cazadero Station (1 fire engine)
- The Sea Ranch Station (1 fire engine)
 - Includes a Schedule A funded two-person engine company.

CAL FIRE closed the Black Mountain Conversation Camp, which was located along Fort Ross Road near Brain Ridge Road, in 1992. Since the closure of Black Mountain, the nearest camps serving Battalion 1411 are in Mendocino County east of Fort Bragg (Parlin Fork), Solano County near Travis Air Force Base (Delta), and Lake County near Lakeport (Konocti), all several hour drive times. These crews are not a viable option for fuels reduction and other projects in Battalion 1411 due to the extended travel times. Crews also have an increased response time to emergencies unless they are working in other parts of Sonoma County.

There have been no large and damaging wildland fires since the Creighton Ridge fire in August of 1978. Most fires are contained and controlled within the first few hours of detection. Because of the amount and type of fuels that wildland fires in Battalion 1411 consume, resources are often required to remain on scene of wildland fires through the night and during the followings days to ensure the fire does not escape established control lines. Prior to the Creighton Ridge fire, significant fires occurred in the 1950s and 1960s, including fires along Highway 116 in the Russian River area. Other notable fires which required an extended commitment of resources was:

- 1993 Gerstle Fire, Salt Point State Park, 460 acres
- 1997 Yardham Fire, The Sea Ranch, 300 acres

Weather along the Coast during the summer months is generally characterized by fog and moderate temperatures. Sunny days are more common during the Spring and Fall season. Fog does not usually extend above 1,000 – 1,500 feet, and does not intrude inland past the first ridge adjacent to the ocean. This allows the interior portions of Battalion 1411 to remain warm and dry throughout the day and night. Some of the canyons are narrow and filled with large trees and can remain cool and moist through the Summer and Fall seasons. A remote automated weather station was installed near the Oak Ridge Lookout near Annapolis in September 2016 to capture the inland weather conditions in Battalion 1411.

Critical fire weather patterns characterized by hot, dry, and windy conditions are not very common along the Coast, and are on average, three to four days a year. These conditions will result in rapid fire growth, including crown fires, and spotting. All property owners, residents, and fire fighters need to be prepared for this “rare” event. The most damage will likely occur within the first several hours of the fire as the fire outpaces the deployment of fire suppression resources.

Battalion 1411 has areas of Sudden Oak Death (SOD). Aerial surveys have been conducted the United States Forest Service. It is unknown exactly how SOD will affect fire behavior, but weakened trees have fallen and blocked roads.

The scenario exists for a wildland fire to burn undetected for a period of time, with difficult access, as a

critical fire weather pattern is developing or occurring. Another possibility is the passing of a lightning storm resulting in fires that cannot all simultaneously be contained. These scenarios could lead to a large and damaging wildland fire.

CAL FIRE is also able to accomplish projects in consultation and coordination with community members and homeowner associations such as The Timber Cove Homeowners Association (TCHOA), The Sea Ranch Association (TSRA), and FIRESAFE councils at the County and community based level. There are many State and Regional Parks, open space preserves, and commercial timberland in the Battalion in 1411.

Pole Mountain Lookout is a privately funded lookout post between Muniz Ranch Road and the Cazadero community. The lookout is operated by the non-profit Pole Mountain Fire Lookout Association (Incorporated), staffed daily during the summer, and supervised by the Russian River Battalion Chief (B1411). Pole Mountain is able to provide critical early detection of wildland fires in areas lacking cell phone coverage and are not heavily populated.

Homeless encampments along the Russian River in/near the communities of Guerneville and Monte Rio have increased the number of fires caused by campfires. Improper disposal of ashes from fire places and barbeques has led to an increase in ignitions usually during the fall months when residents begin using fire places and rainfall has not made vegetation fuels moist enough to not readily burn.

Past Projects

CAL FIRE staff worked with the TSRA in development of their Fire Management Plan and Community Wildfire Protection Plan. Emphasis is placed on the lands adjacent and grasslands west of Highway 1.

CAL FIRE has hosted community based meetings in The Sea Ranch, Timber Cove, Cazadero, and Armstrong Redwoods area the past summers. Battalion 1411 personnel post fire preventions signs in high profile locations, conduct defensible space inspections in target areas, maintain a presence at large community events, and participate in many other forms of public education.

Battalion 1411 personnel have held community meetings, performed defensible space inspections, and worked with individual property owners and communities.

Battalion 1411 personnel have worked with the Stewarts Point Rancheria staff to develop a local operating plan for wildland fires and have conducted pile burning on Rancheria property to reduce wildland fuel loading.

Present Projects

Battalion 1411 personnel continues working with the California Department of Parks and Recreation to conduct prescribed control burns in the State Parks. The focus has been on pile burning but plans are being formulated to carry out additional control burns in the future, and expand the burning program. The intent of these burns are to manage fuels in the State Parks, including fuel reduction to reduce fire behavior, and decrease the spread of invasive species. These control burns also offer a training opportunity for CAL FIRE and cooperating agencies, helping us work better together during emergencies.

Battalion 1411 personnel participate in defensible space inspections programs. Defensible space inspections allow CAL FIRE to interact with homeowners and discuss fire prevention and mitigation plans. Battalion personnel also become more familiar with assets at risks, access, and concerns that residents may have.

CAL FIRE personnel are improving a dirt road between the end of Muniz Ranch Road and the Padmasambhava Peace Institute to serve the purpose of egress/ingress and as a shaded fuel break. Vegetation along the road is being removed and/or reduced (lower limbs pruned) to reduce the intensity of an approaching fire.

Future Projects and Ranking

Battalion 1411 personnel will continue to host community meetings and rotate locations to have exposure to the largest amounts of people. The purposes of these meetings are to increase the awareness level of preparing for wildland fire, defensible space, and actions to take during a wildland fire. Battalion 1411 personnel will also submit letters and articles to homeowners groups, media, and other publications.

Battalion 1411 personnel will engage in the development of pre-fire response plans and other related documents, and maps for wildland areas, some remote, with high density structures such as Brushy

Ridge Loop in Annapolis and the Timber Cove area.

Battalion 1411 personnel will also support grants undertaken by Fire Safe Sonoma, land management organizations, fire departments, and other community groups.

Total Fires by Cause: Battalion 11

Battalion 1412 Glen Ellen/Petaluma (West Division)

Battalion 1412 encompasses southern Sonoma County; the Sonoma Valley and the Petaluma area, separated by Sonoma Mountain. Within the battalion are several full-time local government fire departments as well as volunteer based fire departments. There are two CAL FIRE stations, one just west of Petaluma staffed with one fire engine, and the other along Highway 12 south of Kenwood that houses two fire engines and a bulldozer.

Ignition Management

The top three fire causes in Battalion 12 are vehicle, equipment, and debris burning. To prevent large fires or property loss from a fire caused by a vehicle, our projects have focused on identifying hazard areas and build fire breaks alongside roads. Equipment caused fires are mostly from mowing for agricultural or homeowners. Equipment caused fires and debris burning caused fires is a top topic we focus on during our fire prevention activities, such as during LE 100's or public events.

Past Projects

Past projects have been funded through BLM's Community Based Wildfire Prevention Grants Program using a variety of methods to get the actual work completed. Near Glen Ellen, a grant was sponsored through Fire Safe Sonoma, to establish a safety corridor and a secondary ingress and egress route in a high hazard area adjacent to Annadel State Park. Another project, also sponsored by Fire Safe Sonoma used Sonoma County work crews to clear roadways that had been overgrown by vegetation. Along five miles of Trinity Road in the Mayacamas Mountains east of Glen Ellen, a shaded fuel break was created using CAL FIRE Fire Crews, residents, and county work crews. The Trinity Road fuel break was funded by the Forest Stewardship, a previous program similar to BLM's Community Based Wildfire Prevention Grant Program. Additionally, focused LE 100 inspections have been done in the area east of the town of Glen Ellen, in the Cavedale/Trinity road area. There also have been fuel breaks created along the northbound direction of highway 101 along the Cotati Grade. A fuel break along Bennett Valley Rd, and a shaded fuel break along the southern portion of the Sonoma Developmental Center. These past three projects were constructed using the drought funded Fire Fighter Fuels Crew. Approximately 300 inspections a year have been accomplished in these areas. Other past projects include the "East Sonoma Pre- Attack Fire Plan." This pre-attack plan consists of a two-sided tri-fold brochure that contains map a Contingency map on one side and an Operational Safety Briefing, Staging Areas and Escape route descriptions on the other side. The Pre-Attack Fire Plan will be beneficial to cooperating fire agencies along with Department resources in event of large scale wildfire occurring in the area.

Present Projects

Present projects consist of educational information to homeowner associations and local community events. These events allow us to interact with the public to discuss fire prevention and mitigation plans.

We also commit fire prevention and suppression resources to 3 large events at Infineon Raceway during the summer race season. Infineon Raceway is located near Sears Point along Highway 37 entirely in the SRA. The raceway holds several events during the summer months that attract upwards of 100,000 spectators per event.

Battalion 1412 personnel participate in defensible space programs targeting high risk areas within the Battalion, including Los Alamos road leading into Hood Mountain Regional Park, Lichau road along the western slope of Sonoma Mountain, and Lovall Valley road south east of the town of Sonoma

Future Projects and Priority Rankings

Currently, there are plans to extend the "Pre-Attack Fire Map" program to include all portions of the Sonoma Valley, pending grant funding. We will also create a shaded fuel break in the Bennet Ridge subdivision east of Santa Rosa. The purpose of this project is to lessen the impact of a fire leaving Annadel State Park and impacting this subdivision. This project is being coordinated with State Parks and the Bennet Ridge Homeowners Group.

A shaded fuel break along the eastern portion of the Sonoma Valley from E. Agua Caliente Rd. extending south to Lomita road. This fuel break would be instrumental in the protection of 100's homes

businesses and residents in the area of Agua Caliente, Feters Hot Springs, Boyes Hot Springs and El Verano in the Valley of the Moon just north of the city of Sonoma.

A similar break along 4th St. East to Lovall Valley road. This would also assist in protecting the city of Sonoma itself.

A roadside right of way clearing along Arrowhead Mountain road allowing for safer egress from Lovall Valley Loop. The Lovall Valley Loop Road area is actually in Napa county, however it is only accessible via Sonoma County and is a dead-end road. Fire impacting Lovall Valley Road would prevent residents from evacuating the area of Lovall Valley loop.

An additional roadside right of way clearing along the entire length of Cavedale road. This fuel break would improve the safety of Cavedale road as an evacuation route and also serve as a fire break in the event of a large fire.

Total Fires by Cause: Battalion 12

Battalion 1413 Healdsburg/Cloverdale (West Division)

Northeastern Sonoma County, including the unique Geysers geothermal area, and the Army Corps of Engineers Lake Sonoma Project, are within Battalion 1413. Most of the battalion is very rural, with only two incorporated cities, Cloverdale and Healdsburg. The burn permit process generates over one hundred public contacts each year, giving Battalion 1413 personnel the opportunity to both educate and inform agricultural industry related personnel and residents about wildfires. The battalion stations are Healdsburg with two engines and a bulldozer, and Cloverdale staffed with two engines.

Past Projects

The Battalion has been very busy with pre-fire management programs in the past ranging from vegetation management program (VMP) control burns in the Geysers Geothermal area in Northeastern Sonoma County to homeowners working with CAL FIRE and the local fire department to reduce fuels in the Fitch Mountain area in Healdsburg, the Vineyard subdivision in Geyserville and the Palomino Lakes subdivision in Cloverdale.

Previously, the City of Healdsburg Fire Department contacted CAL FIRE for advice on its' growing wildland/urban interface fire hazard, particularly on the City's north and east flanks. This area comprises the steepest and highest elevations in the city, on Fitch Mountain, and area adjacent to it, which is SRA. Working with Fire Safe Sonoma, Healdsburg Fire Department, and the Sonoma County Department of Emergency Services, a plan was developed for a multi-phase fire environment modification. Funding was secured through a Western Wildland Urban Interface Grant administered by the USDA Forest Service. This project was implemented with LE-100 defensible space inspections, a community chipper program, and the re-establishment of an alternative fire access road. California Conservation Corps (CCC) crews were also used.

In the Palomino Lakes subdivision, CAL FIRE and the Cloverdale Fire Protection District coordinated with the Palomino Homeowners' Association to reduce fuel loading. The Palomino Lakes subdivision has experienced damaging fires in the past. Private contractors were used to clear vegetation along roads, and chip over seventy-five cubic yards of vegetation. Along with the work, a community meeting was held. CAL FIRE maintains an agreement with the Army Corps of Engineers for wildland fire protection. Each year under this agreement, a meeting is held to discuss the contract. Part of CAL FIRE's responsibility is to train staff in wildland firefighting, discuss fire prevention issues, and pre-plan emergency response. Much of the lake's campgrounds are remote and access is only via a boat and/or fire roads.

CAL FIRE fire crews are used to construct precautionary handlines around the campsites prior to fire season, and bulldozers and graders are used to maintain the fire roads on a rotating basis. A fire prevention display is kept at the visitors' center as well as a fire prevention sign and fire danger rating sign along the roadway leading to the lake's main access. Each year CAL FIRE coordinates and participates in burning off the 80 acre dam face with many local departments participating, making it a valuable training tool for all.

The Battalion Chief works closely with local government cooperators, annually holding a multi-agency drill that replicates a wildland-urban interface wildfire response. This event, while providing training for CAL FIRE and local government personnel, increases wildfire awareness and prevention in the community in which the drill is held. The image of a fire engine backed in a driveway, with fire fighters in full personnel protective equipment and fire hoses deployed generates discussion amongst homeowners and CAL FIRE. Additional benefits include area orientation and pre-planning for fire fighters, the opportunity for homeowners to approach fire fighters, and for personnel from different fire departments the opportunity to interact.

Battalion 1413 personnel also complete over 200 LE-100 defensible space inspections each year. The Battalion Chief targets an area for each station to complete inspections, using *direct* mailers asking for volunteer compliance or self-inspection. CAL FIRE personnel then complete follow-up work to ensure compliance. This LE-100 approach in conjunction with the aforementioned multi-agency drill bodes well for promoting the concept of defensible space in the designated area.

Present Projects

Battalion 1413 continues to meet annually with Calpine to improve clearance around power plants, fuel breaks along roadways, road signage, and adding fixed water tanks for helicopter use.

Battalion 1413 personnel actively participate in community events, such as the Healdsburg Future Farmers of America (FFA) parade held on Memorial Weekend of each year and the Cloverdale Citrus parade held in

February.

Calfire has partnered with the California Conservation Corps to brush and chip along Mill Creek Road.

Future Projects and Priority Rankings

Upcoming focus will be on the Fitch Mtn. area in Healdsburg and the Pine Mountain area in Cloverdale. The current Battalion Chief has met with homeowner groups in both areas numerous times and have prepared them for what to expect for the LE-100 program and future inspections and how to prepare their homes if a fire is in their area.

Total Fires by Cause: Battalion 13

Battalion 1414 St. Helena (South Division)

Battalion 1414 covers northern Napa County from the small community of Rutherford to the top of Mt. St. Helena and east to Angwin. Highway 29 is the major traffic corridor through the battalion. Las Posadas State Forest is within the confines of the battalion, and there is a fire station on the forest property with one CAL FIRE type 3 fire engine. Other CAL FIRE resources in the battalion are two CAL FIRE type 3 engines, and a CAL FIRE Schedule "A" type I with a staffing of 2/0 at St. Helena.

Angwin is a rural enclave located on Howell Mountain, between the Napa Valley on the west and Pope Valley on the east. Surrounded by forest and vineyards, Angwin includes about 1000 homes and is comprised of approximately 3000 permanent residents; the Pacific Union College campus and Preparatory School with a student undergraduate population of more than 1600; an 8-acre commercial/retail center at Howell Mountain Road and Brookside Drive; a smaller commercial area of businesses along with the Angwin Volunteer Fire Department on College Avenue; and various home-based businesses and wineries dispersed throughout the community. The community's overall "sense of place" and character is largely derived from its agrarian and forested environment. Conn Creek, which drains an area of 60 square miles, flows across the Angwin basin and over Linda Falls before flowing into Lake Hennessey Reservoir that provides nearly 70% of the drinking water supply to the City of Napa. Much of the forested areas of Angwin contain flammable dead and dying understory and/or large stands of prolific species that increase ignitability of the forest canopy.

Angwin is the interface between wildlands and dispersed unincorporated developed areas. The fire hazard severity in Angwin is considered "very high". (Napa County General Plan, 2009) Sitting atop Howell Mountain, Angwin's forest-covered slopes together with weather and human activity create the potential for catastrophic fire. Vineyards cover approximately one-third of the acreage in the Angwin area outside the residential and commercial areas. A single narrow, winding road traverses Howell Mountain from the Napa Valley to Pope Valley, providing the vehicular access to and from Angwin. Only two other roads extend to valley floors from the Angwin area – Ink Grade on the eastern side and Old Howell Mountain Road on the western side. Napa County has a recurring history of large fires that typically burn for several days or longer. Mountain fire in 1977 burned 2,500 acres in 5 hours. Two fires, one in 1964 and another in 2008, started at the "hairpin turn" on Deer Park Road. The fire in 2008 burned 300 acres primarily across the western face of Crestmont Ridge. In 2014, the Butts Canyon Fire burned 4,300 acres at the northern base of Howell Mountain.

Deer Park is an unincorporated community in Napa County located in the forested foothills to the northeast of St. Helena. It has grown up largely around the St. Helena Hospital and Health Center which was founded in 1878. The highest residential density is in the area around the Hospital where the lots are small and the streets are haphazard in their layout and extremely narrow and steep in some cases. Some of the housing stock in this area dates to the time of the Hospital's founding and the balance of it is probably 50 to 100 years old. Fortunately for this neighborhood the Deer Park Volunteer Fire Department is located on the Hospital grounds.

Other neighborhoods have been developed over time with the most recent being Crestmont, Wailima Estates, and Fawn Park. The homes in these areas were typically built to modern building code standards and are situated on larger lots. Some of the homes in Deer Park are located on large parcels with long driveways for access. There are several private bridges over Bell Creek along Crystal Springs Road and Glass Mountain Road that provide the only access to homes on the other side of the Creek.

Because Deer Park is in the interface between wildlands and developed areas, fire hazard is a special concern. Fires may spread from wildlands to the homes, possibly damaging structures or even threatening lives. Conversely, wildlands are subject to increased ignition potential from elevated levels of human activities, and most fires in the Coastal mountains are human-caused.

Topographic features-such as slope, aspect (orientation with respect to sun and wind), and the overall form of the land-have a profound effect on fire behavior. Topography affects a wildfire's intensity, direction, and rate of spread. An area's topography also affects local winds, which are either "bent" or intensified by topographic features. Topographic features can also induce daily upslope and down slope winds. The speed, regularity, and direction of these winds (and other winds) directly influence the direction of wildfire spread and the shape of the flame front.

The terrain in Deer Park is convoluted, and Complex. Several canyons converge near the St. Helena Hospital. Two main features are the valley following Crystal Springs Road (continuing to Mund Road) and the long slope below Crestmont Drive. Slopes are generally moderate in steepness, apart from the canyon along Deer Park Road near the hospital and the southerly trending portion of Mund Road. A set of minor ridges to the north and south of Deer Park Roadblock winds from the west, and create a gap, or funnel, up to Sanitarium Road. Broad valleys are otherwise the rule. The elevation of Deer Park rises from approximately 200 ft. on the Napa Valley floor to 1600 ft. at the top of Crestmont Drive.

Many contacts with the public are generated through the burn permit process. Most of the Napa Valley floor, and some of the hillsides, are planted with grapevines. This industry has a heavy reliance on burning to dispose of agricultural trimmings.

Battalions 1414, 1415 and 1416, assist Napa County Fire Department volunteer fire companies. Assigned to Battalion 1414 are Deer Park, Angwin, and Rutherford. St Helena and Calistoga cities also have their own organized fire departments and respond with CAL FIRE daily to incidents. All three battalions are included in the Napa FIREWISE program, a cooperative effort between CAL FIRE, Napa City, Napa County, Resource Conservation District, and local Fire Safe Councils.

Past Projects

The majority of past projects have been in the wildland-urban interface areas on the west aspect of the Napa County. There are two communities, Deer Park and Angwin, and many other clusters of homes in this Wildland-Urban-Interface (WUI) area.

The Angwin fuels reduction project along Howell Mountain Road starting just west of the community and continuing east towards Pope Valley. The project's objective was to reduce the flashy fuel accumulation near the main access corridors and other assets at risk while protecting timber and wildlife resources. The primary method to accomplish this objective was through manual and mechanical treatment using CAL FIRE crews from Konocti Conservation Camp. Fuels were removed manually and chipped.

Fuels reduction project along Deer Park road from Mund to Crestmont. and the area surrounding the St. Helena Hospital. The objective of this project was to reduce the heavy brush fuel load that could contribute to a fast moving, high intensity wildfire that would endanger a major health care complex and the surrounding residential communities. Work was performed by CAL FIRE Crews from Konocti Conservation Camp to prune trees, cut brush, and remove dead woody ground material. Removed fuels are chipped and spread onsite.

In the early 1990's a VMP project was completed in the Crestmont area of Deer Park. The Deer Fire of 2008 burnt in the footprint of this project and assisted with fire suppression efforts.

In 2013 the community of Deer Park established a Fire Wise Community Council and established a workable and comprehensive CWPP that address the need for fuel reduction throughout the community.

In 2015 the community of Angwin established a Fire Wise Community Council and established a CWPP that will concentrate on fuels reduction with in the community and along the major traffic corridors that may be utilized for evacuations if needed.

In 2008 the "Angwin/Deer Park Pre-Attack Fire Plan" was completed. This includes the development of proposed Contingency Areas for the containment of wildfires. Also included in this plan are strategy and tactics, staging areas, command and tactical frequencies, and other information critical to containing and suppressing a wildland fire in the Angwin and Deer Park Communities.

Present Projects

Hwy 29 fuels reduction project, this project is concentrating on reducing fuels along Hwy 29 from Tubs lane north to Robert Louis Stevenson State Park. The objective of this project is to reduce the fuel loading along the highway allowing for a more secure evacuation route from Lake County and reducing the risk of a wildland fire from vehicular traffic.

The Deer Park Fire Wise Community Council continues to work on fuel reduction projects along Sanitarium and Sunnyside Roads, and the completion of the north of Crestmont.

In Angwin the Fire Wise Community Council is just starting their shaded fuel break along Ink Grade and Howell Mt road and is hoping to complete in the late spring of 2017.

Los Posadas Forest shaded fuel work along Los Posadas road is near complete, the only remaining items are the burn piles. The crews have move interior to work on a fuel break between LP and the PUC property boundaries.

Future Projects and Priority Rankings

Future project priorities include the continuation of shaded and fuel reduction projects that are outlined in both the Angwin and Deer park CWPP's. Coordinate the efforts of the forest thinning project along the boundaries of LP and the PUC property lines. Continue the LE-100 inspection project in the community of Angwin.

Battalion 1414 is placing emphasis on the reduction of fuels along egress routes and a concerted effort to provide education through LE-100 inspection and community interaction. Angwin and Deer Park are participating in the Napa County FIREWISE chipping program.

Total Fires by Cause: Battalion 14

Battalion 1415 Lake Berryessa (South Division)

The eastern edge of Napa County including Lake Berryessa makes up the LNU South Division portion of Battalion 1415. Lake Berryessa is a recreational destination and generates many medical related calls for service and the potential for large wildfires. Surrounding the lake, and along the roadways leading to the lake, are rural subdivisions, such as Circle Oaks, Berryessa Highlands and the Berryessa Estates, which increase the assets at risk.

There are two CAL FIRE stations in Battalion 1415, Spanish Flat with two fire engines near Lake Berryessa and Gordon Valley, a single engine with bull dozer, located approximately one mile north of the Napa/Solano county line.

Battalion 1415 administers the volunteer fire companies of Pope Valley, Capell Valley, and Gordon Valley. CAL FIRE Spanish Flat Station and Gordon Valley station are both open year around through an Amador agreement with Napa County Fire Department.

Past Projects

Past projects have been around two of the developed subdivisions. In the 338-lot Circle Oaks subdivision, a multi-year fuel modification project is being funded, in part, by the BLM through the Community-Based Wildfire Prevention Grants Program. Circle Oaks represents the largest concentration of people and houses in Napa County. In 2002 they completed a Fire Safe and Fuel Management Plan.

The Circle Oaks subdivision is located along Highway 121 between the City of Napa and Lake Berryessa. The fuel modification aims at making it possible to contain vegetation fires that start within the subdivision to the subdivision, and to protect the subdivision from any encroaching wildfire. Shaded fuel-breaks were created along Napa County roadway easements. Over 2,500 tons of fuels have been removed from the perimeter greenbelt defensible space zone, and almost 300 tons of additional vegetation from vacant lots. An estimated 800 cubic yards of vegetation was removed from around structures following a LE-100 defensible space inspection program, and right-of-way clearance was accomplished along seven miles of road.

Berryessa Estates is a remote subdivision in the northeastern portion of Napa County consisting of approximately 180 lots. Due to many factors including remote location causing long response times, one-way access, high- density flammable fuels with intermixed structures, this subdivision has been designated as an area of concern regarding wildfire. CAL FIRE personnel along with Pope Valley volunteers, and the Napa County Road Department worked with the Berryessa Estates Homeowners Association (BEHOA) to have members of the Association clear fuels around their homes to then be chipped. A total of fifty piles were chipped. The BEHOA subsequently formed the Berryessa Estates Fire Safe Council (BEFSC)

Partnered with CAL TRANS to conduct roadside fuel reduction project along Monticello Road, a major travel route between the Southern Lake Berryessa Communities and the City of Napa.

Present Projects

Berryessa Estates, Circle Oaks, and now Berryessa Highlands are the high density high wild fire risk communities that continue to need the most hazard reduction attention in the battalion. All three areas are heavily supported by the Napa Communities Firewise Foundation (NCFF) and the LNU Pre-Fire Engineering division through pre-planning, the free chipping service, and grant awards.

The community of Berryessa Estates Fire Safe Council works very hard to improve the wildland fire survivability of their community. With strong support from NCFF, BLM, and CAL FIRE, they have completed

a 2 mile by 100 foot wide fuel break around the entire community that is the largest fuel break of its kind in Napa County. The fuel break was accomplished by the combined use of a mechanical brush masticator, CAL FIRE inmate fire crews, and supported by the NCFF chipping program. Project funding is a combination of direct BLM funds, along with NCFF and the California Fire Safe Council sponsored federal grant money. The community of Berryessa Estates through NCFF was also able to secure a federal grant as well. With the help of Circle Oaks, they also began using an automated calling tree service (Call-Em-All) to help with fire safety communication, Fire Safe Council announcements, and emergency notification. The fuel break along the western edge of the community was integral in the overall incident objects for the Butts Fire this past summer, allowing incident commanders to place additional resources on perimeter control that otherwise would have been tasked with creating a fuel break around the community. Additionally, previous controlled burning by CAL FIRE/Napa County Fire Department created an area temporary refuge area for residents during evacuations when Snell Valley Road, the community's only escape route, was blocked by fire. The BEFSC has completed a CWPP.

Circle Oaks has continued to be the most progressive community with the longest history of intense wildland fire hazard mitigation efforts in Napa County. Through the leadership of their homes association and fire safe committee, along with NCFF and CAL FIRE, they have become the first and only nationally

recognized Firewise USA Community in the County. They have on-going success with federal grant funding awards, along with expanding and maintaining fuel reduction projects, and have since completed

and official CWPP. Their latest project is a continuous shaded fuel break surrounding the entire subdivision. Circle Oaks continues to do their own defensible space inspections with the help of CAL FIRE/ Napa

Co Fire as needed and they do a great job of wildland fire safety and education with the residents. The automated calling tree service continues to be a good tool in communicating their fire safety related messages.

Berryessa Highlands located at the South end of the Lake Berryessa, has become the another community in the battalion to concentrate on improving wildland fire safety. In a cooperative effort with the NCFF, CAL FIRE, US Bureau of Reclamation, Napa County Public Works, and a core group of residents, the Berryessa Highlands Fire Safe Council was formed in 2011. This group prioritized the fire safe projects in the area, completed a CWPP, and will pursue future grant funding. The first fuel projects completed included an infrastructure (community water treatment plant) fuel break, community entrance road side fuel break, and strategic interior one hundred foot fuel breaks below homes on steep slopes. CAL FIRE inmate hand crews were used on these projects with the support of the NCFF chipper and grant funding. The 100 foot fuel break started 100 feet below the homes with the residents being responsible for their required defensible space. Due to the steep slope and chimneys it was determined that an additional one hundred feet was needed. Permission was received from the large parcel owner and notification was made to the nearby subdivision parcel owners that inmate would be doing the work with a second crew supervisor present. The priority for these interior fuel projects is to clear the brush first on the south and west slopes then provide shaded fuel breaks under the oaks on the north and east slopes. The BHFSC, CAL FIRE and The United States Bureau of Reclamation (BOR) collaborated to construct an approximate 3/4 mile long fuel break along the western edge of the Berryessa Highlands community.

Gordon Valley community is located in south eastern Napa County. The community is composed of scattered ranchettes ranging from 5 to 40 acre parcels as well as larger ranches. The majority of the population is located in areas with narrow single lane roadways. The fuels and topography vary from flat grassy meadows to steep brush covered slopes. The Gordon Valley Fire Safe Council (GVFSC) was formed in 2013 and is in the process of finalizing their CWPP. The GVFSC is predominately funded through NCFF and has recently partnered with Napa County Public Works to conduct a roadside fuel reduction project along both Wooden Valley Cross Road and Gordon Valley Road, the two most heavily traveled roads in the community. The work was completed by CAL FIRE inmate hand crews with the NCFF chipper. The GVFSC utilizes an automated phone

tree and the Next Door program to notify area residents to communicate fire safety related messages area residents.

Future Projects and Priority Rankings

Priority for projects will continue to be placed on those sponsored or supported by the Napa Communities Firewise Foundation (NCFF), and in communities that show an interest in taking the lead to improve their fire safety. With federal grant funding being less available through the NCFF it must become a priority for each of the communities in the battalion to assist with fundraising in order to continue the support of programs like the free residential chipping.

Controlled burns and fuel break projects are being planned between CAL FIRE, The Bureau of Reclamation (BOR), and The Department of Fish and Game around Lake Berryessa. Recently the BOR has transitioned the recreational areas around the lake to a more traditional recreational and less permanent resident model. BOR is currently developing a prospectus to guide the development of the 6 recreational areas surrounding Lake Berryessa, CAL FIRE/Napa County Fire is working closely to ensure wildland fire safety is included in this long term plan.

Construction of a shaded fuel break along the northern edge of the Berryessa Pines community, once completed this at risk community will have a shaded fuel break constructed by CAL FIRE around the majority of the community.

The construction of a shaded fuel break along the western perimeter of the Green Valley subdivision in Solano County is in the planning stages. This project would be the first SRA Fee funded fuel reduction project in Solano County.

Total Fires by Cause: Battalion 15

Battalion 1416 Napa (South Division)

Our Mission: Working together for your safety: Proudly serving our community with courtesy, integrity and compassion.

The Napa Valley runs north and south with fairly dense oak woodlands on the hills to the east and west. The Valley floor is mostly populated with ranch style properties, wineries and grape vineyards. Additionally there are many canyon roads with wildland urban interface (WUI) on the east and west sides of the Valley. The actual geographic boundary extends to the northwest as far as Dry Creek Rutherford area where it overlaps with Battalion 14 and northeast up to Atlas Peak. The southern boundary covers pockets of Napa County and SRA that extend beyond American Canyon Fire Protection District almost to Highway 37. The western boundary extends west to the Sonoma County line with pockets of SRA and Napa County throughout bordered by Battalion 12. The eastern boundary in some areas extends to Solano County line with pockets of SRA beyond and bordered by Battalion 15 near Wooden Valley Road.

The Battalion has auto and mutual aid agreements with the surrounding agencies of:

- Napa City Fire Department, central.
- American Canyon Fire Protection District, to the south.
- Cordellia Fire Protection District, to the east.
- Schell- Vista Fire Protection District, to the west.
- Napa State Hospital, central.

These agreements assist with all incident types but particularly affective getting resources at scene of wildland fires in those areas quicker.

Battalion 1416, which falls under the South Division Operations, has three career stations and four volunteer stations.

Resources assigned in Battalion 16 are:

Station 12, Yountville CAL FIRE Staffed	Station 25, Napa CAL FIRE Staffed	Station 27, Greenwood Ranch, CAL FIRE Staffed
Truck 12, 105' Ladder	Engine 25, Type 1	Engine 27, Type 1
Engine 12, Type 1	Engine 1466, Type 3	Engine 1476, Type 3
Rescue 12, NIRT	Water Tender 25, NCFD	Haz Mat 27, NIHIT
Utility 12	Support 25, NCFD	Utility 27
Reserve Engine 1	Utility 25	

Station 10, Carneros Volunteers	Station 13, Soda Canyon Volunteers	Station 15, Rutherford Volunteers	Station 16, Dry Creek Volunteers
Engine 10, Type 1	Engine 13, Type 1	Engine 15, Type 1	Engine 16, Type 1
Engine 210, Type 3	Engine 213, Type 3	Engine 215, Type 3	Engine 216, Type 3
	Patrol 13	Rescue 15	Patrol 16
		WT 15, 3000 Gals.	WT 16, 1800 Gals.

Battalion 16 Fire Plan Updates

Defensible Space priority areas.

Dry Creek Road, Redwood Road, Mt Veeder, Atlas Peak, Monticello Road, Coombsville East from 1st Ave

Past Projects:

Dry Creek fuel break, Napa Sonoma County line, (expand from CWPP).

Atlas Peak shaded fuel break.

The Cove Girl Scout Camp fuels reduction.

Use of the Napa Firewise Chipper Program.

Future projects:

Atlas Peak CWPP maintenance.

Mt Veeder CWPP updates, (pull from grant information).

Yountville Veterans Home fuels reduction.

Enchanted Hills Camp for the Blind fuels reduction on a 310 acre camp off Mt Veeder Road.

Continued use of the Napa Firewise Chipper Program.

The Battalion 16 leading causes of fires are:

#1 Undetermined, 46%

#2 Vehicle/Miscellaneous 13%

#3 Debris Burning/Electrical Power 12%

The plan to reduce wild fire ignitions in the number one class will be to better train personnel in fire cause determination by providing more FI210 courses (wildland fire determination). Additionally, providing Battalion Chief and Prevention Officer assistance when doing the initial investigation.

Public information and education will help reduce ignitions in the second and third classes. Educating residents on the importance of proper debris burning techniques like; having an available water source, constant monitoring of piles, mineral soil control lines around piles and proper pile sizes will reduce debris burning escapes.

Additionally public education programs can help citizens understand the importance of proper vehicle maintenance and in the event of a fire not pulling into the vegetation before exiting the vehicle.

Pre fire attack plans have been created for Dry Creek – Lokoya and Soda Canyon Monticello areas.

These fire plans provide comprehensive preplanning for wildland fires providing:

Control line locations, contingency plans, staging areas, water supplies, evacuation routes and resident locations. They will also assist with logistical considerations, fuel types, expected weather patterns and expected fire behavior.

The plans are carried by all responding resources, extras are usually available to provide to out of unit resources coming to assist in operations.

Total Fires by Cause: Battalion 16

Battalion 1417 Middletown (North Division)

Battalion 17 covers most of the southern portion of Lake County. A large portion of the Battalion is also the South Lake County Fire Protection District which is a schedule "A" contract with CAL FIRE. The District also has the South Lake County Fire Safe Council. Highway 29 is the major traffic corridor through the Battalion with heavy commuter traffic to Sonoma and Napa counties.

The CAL FIRE facility in this battalion is Middletown Station (Station 31), equipped with two engines and a dozer. The cooperative fire protection contract with the South Lake Fire Protection District is to staff three Schedule "A" stations and one Volunteer station. Two paramedic units, one near Cobb and the other in the Hidden Valley Lake subdivision are staffed utilizing CAL FIRE paramedics. The district operates two additional fires stations using a combination of career and volunteers to staff.

The South Lake County Fire Safe Council is active. It covers an area of approximately 293 square miles. They have received funds through BLM and the SRA Fee Program several times over the past few years for various projects. The Council coordinates a chipping program, community meetings, public service announcements, fire prevention and safety related signs and events throughout the area.

Hidden Valley Lake is an approximately 3,000-parcel subdivision, along Highway 29 and is a gated community that has incorporated Public Resources Code 4290 and 4291 defensible space laws into their home owners' code of conduct and regulations. They also maintain a fuel break around the subdivision, as well as completing fuel reduction for the "common" areas of undeveloped land. They are a Firewise Community.

The community of Lower Lake, the City of Clearlake, and all of the Lake County Fire Protection District are within Battalion 17. The fire activity in the LRA and the City continually cause an ongoing threat to the SRA. This area also contains the Clearlake State Historic Park that is in the LRA, in the City limits and in the SRA. This area's local emergency delivery services are staffed with one engine and two ambulances 24/7/365 provided by the Lake County Fire Protection District. The highest populated area in the SRA was heavily affected by the Clayton Fire in 2016. The rest of the SRA in this area is rurally populated.

Present Projects

- *Continue with the Chipping Program
- *New Cal Fire Prevention sign placed on the major traffic routes
- *Grants have been submitted for fuels reduction projects through the local fire safe council
- *Control burns, salvage logging, and re forestation at Boggs Mountain State Forest
- *Large Animal Evacuation Program established through the County's Animal Control called LEAP
- *Vegetation Management continued with UC Davis and Fish and Wildlife in the Morgan Valley Area
- *Community meetings/Education
- *Fuel Breaks - Shenandoah Fuel Break, Bottle Rock Fuel Break, Anderson Springs Fuel Break, Hidden Valley Fuel Break, Davis Creek fuel break from the dump to Cache Creek, St Helena Hospital Clearlake Fuel Break, Carter Lane Fire Road, Harbin Springs Ridge Fuel Break, Montesol Ranch Fire Road to Oat Hill Mine Road and Dead Horse Flat Fire Road.

Total Fires by Cause: Battalion 17

Battalion 1418 Kelseyville/Clearlake Oaks/Boggs Mountain (North Division)

Battalion 18 has two fire stations and one helitack base. The stations include Kelsey-Cobb station #34, located along Highway 175, outside of Kelseyville and Clearlake Oaks station #40, which is on Highway 20 in the community of Clearlake Oaks. Kelsey-Cobb is staffed with two Type III fire engines, and Clear Lake Oaks is staffed with two Type III engines and a D5H bulldozer. Boggs Mountain Helitack base is the home to copter 104 (Type II) which is located near the community of Cobb. The Konocti Lookout is also within the battalion, and is staffed by volunteers from the Forest Fire Lookout Association (FFLA) Konocti Chapter. Battalion 18 is in Northern Lake County and borders the Mendocino National Forest (MNF). Due to the immediate proximity to the National Forest, Battalion 1418 works frequently with The United States Forest Service, and their resources are incorporated into CAL FIRE initial attack dispatches during summer preparedness dispatches. Battalion 18 also provides direct protection to BLM lands located within the battalion including Cow Mountain, Cache Creek and The Black Forest. In addition, Battalion 18 provides direct protection to the Clear Lake State Park, and the Mount Konocti County Park, both near Kelseyville.

Past Projects

A fuel break incorporating the re-establishment of fire truck trails was accomplished during a training exercise for Dozer Boss students. The break is west of Thurston Lake, and runs north/south between Highway 29 and Pt. Lakeview Road, near the community of Lower Lake. This is where the 2016 Crew Readiness Drill was performed for both Camps that are in the Unit (Konocti and Delta). In the future, this location will continue to hold the readiness drill for conservation fire crews, dozer operators and engine crews at this location. This training will also improve access into this part of the battalion.

The Soda Bay Shaded Fuel Project was performed jointly with the Lake County Fire Safe Council and other stakeholders. The fuel break improves the access/egress for emergency vehicles and provides for safer evacuations from several neighborhood communities located along an 8-mile stretch of Soda Bay Road near the community of Kelseyville. This project was identified in the 2009 CWPP for Lake County. Phase I of the Soda Bay Fuel Break was completed in 2011, providing a twenty-foot fuel break on both sides of the road for four (4) miles.

The County acquired approximately 1,600 acres from a private landowner and opened the land for public use in 2011. These lands are adjacent to land owned by the BLM, and not too far from the Clear Lake State Park. The development of the fire plan is on-going. Currently emergency landing zones have been established along the mountain to facilitate evacuation of people on the mountain in the event of a fire or medical emergency.

Battalion 1418 continues to have a strong working relationship with the Lake County Fire Safe Council and its various partners such as BLM. Battalion 18 personnel are involved with the Lake County Fire Safe Council in numerous ways. Personnel attend monthly Fire Safe Council meetings, assisted during the Lake County Fair and during Wildfire Prevention Week

Current Projects

Projects are based on the priorities of protecting life, property and environment. This will be accomplished by establishing and/or maintaining egress routes, defensible space along the structural interface areas and maintaining fuels breaks in strategic locations.

Projects currently identified in Battalion 18 are: The Bottle Rock Project, the Mount Konocti Interface Fuel Break, The Davis Project, The Spring Valley Project, Boggs Reforest station project.

The Bottle Rock Project is an extension of the current project taking place along Bottle Road and has been started from Cobb to Harrington Flat Road. This project will now enter Battalion 18 at Harrington Flat Road and continue north to Cole Creek Road. The goal is to create a shaded fuel break on each side of the road (100 feet below the road and 50 feet above the road).

The Mount Konocti Interface Fuel Break will focus on creating a fuel break between Mount Konocti and the sub-division in the Riviera. This is an area densely populated and is concentrated in homes, with only two

ways in and out. This interface fuel break will help minimizing fire spread when a fire is established in the Mount Konocti area.

The Davis Project will create a fuel break around the Clearlake Highlands area. The fuel break will go from the county dump to Cache Creek. The goal of this project is to open the fuel break from 50 to 100 feet where possible.

The Spring Valley Project will create a Community Safe Refuge Area. Since there is only one commonly known way in and out of the community of Spring Valley, a Safe Refuge Area will be established to enable residents a safe place to gather should their egress become compromised. Cooperation with The Spring Valley CERT (Community Emergency Response Team) will help the community evacuate in a safer and more efficient manner.

Boggs Reforest station project has focused on burning all the material on the forest floor. The department has staffed Boggs Mountain with personnel to solely work on the reforest station project. The crew has exceeded the expectations of what needed to be burnt so Boggs Mount Forest can replant on the forest this year.

Battalion 18 Ignition Management Plan

Data shows that historically 54% of the fire ignitions in the battalion were from four causes: **Arson** (19%), **Electrical power** (12%), **Equipment use** (13%) and **Debris burning** (10%). Additional fire prevention road signs focusing on the various fire causes, for both wildland and structural, are in three different locations within the battalion. These locations include; Hwy 175 at Red Hills Road, Spring Valley Road cross of Highway 20 and along Highway 20 West of Highway 29. These signs are placed year around with the fire safety message reflecting the proper safety message for that time of year. This helps maintain a presence that Cal Fire is still involved even through the winter months.

LE -100 inspections are conducted by both fire stations. Target areas included North Lakeport, the Clearlake Rivera's near Kelseyville, Lucerne, Clearlake Oaks, and Spring Valley.

Battalion 18 personnel pride themselves in keeping a good working relationship with the public and all local cooperators within and outside the battalion. This positive working relationship enhances moral, maximizes effectiveness and provides for the greatest amount of safety due to open communications at all levels.

Total Fires by Cause: Battalion 18

Battalion 1419 Brooks/Wilbur Springs/Leesville (East Division)

Battalion 1419 runs along the eastern edge of LNU, running the length of Colusa and Yolo Counties. There are three single engine fire stations located near Leesville (Colusa County), Wilbur Springs (Colusa County) and Brooks (Yolo County). The battalion is very rural, with many large landowners. There are a number of intermix and mutual threat areas in all three counties. These include SRA lands that are adjacent to numerous local government fire districts and departments. Battalion 19 consists of over 454,026 acres of SRA, LRA and FRA lands.

Highway 16, which runs from Highway 20 to Interstate 505, has had an above average number of fire ignitions in the area referred to as Rumsey Canyon. The above average number of fire ignitions was primarily due to an arson problem that has been mitigated due to arrests. A significant Wildland Urban Intermix potential exists in areas such as the Century Ranch (Colusa County), Wilbur Hot Springs (Colusa County) and Along Hwy 16 in the Capay Valley (Yolo County).

Past Projects

CAL FIRE has been able to take advantage of the rural setting and large landowners to complete many prescribed burns over the past 20 years. Over the years, specific high fire danger areas have been identified and the focus has been to educate the public on how to improve their land so to protect their homes from Wildfire.

Present Projects

After working with the CAL FIRE Prevention Bureau, It has been identified that debris burning is one of the leading ignition sources in the Capay Valley. Education through proper signage has significantly reduced the number of debris caused fires.

Working with the USFS to complete an understory burn twelve miles out Goat Mt road in the Stonyford area. There are fourteen private land owners called the Little Stony In-holders Group within the Mendocino National Forest. The project is about 900 acres of Forest and private land.

Other projects have included the Bobcat Ranch burn (near the town of Winters), various small burns with Williams Fire Dept., Capay Valley Fire Dept. and Yocha DeHe Fire Dept. Assist with annual Yolo County Fire Departments training burn in Dunnigan. Cal Fire's Northern Region firing class is held near Arbuckle each year. Besides offering training for Cal Fire personnel it creates a firebreak between the SRA Mountains and the LRA valley floor. All of these projects are in accordance to proper CEQA requirements.

Education is a key focus for Battalion 19. Any interaction with the public offers an opportunity to educate in a positive, proactive manner. Fire Captains within the Battalion go to schools to educate students at various ages. After May 1st and until the declared burn ban is in effect, burn permits from the State are required (LE-5). This offers another opportunity for either the Engine crew or Battalion Chief to meet with the public first hand. This again is a time for us to serve the public and educate them on Wildland Fire Safety and how they can protect their home.

LE 100 Inspections

LE-100's will be focused in areas where the greatest population and benefit can be obtained. This enables interaction between CAL FIRE personnel and the public in a positive manner. LE 100 inspections will to be done in the following high risk areas: Century Ranch (Colusa county), Wilbur Hot Springs Area (Colusa county) and in the Capay Valley (Yolo county). CAL FIRE will continue to educate the public through the use of the LE 100 program.

Total Fires by Cause: Battalion 19

APPENDIX B: PRIORITY GOALS AND OBJECTIVES FOR 2017

Sonoma Lake Napa Unit's priorities are identified in bold and a measurement criteria are provided for each of the identified objectives. Throughout the next year, the unit will implement the identified priorities and report on the measurement criteria by June 2016.

LNU is actively conducting several fuel treatment projects during 2015. These consist mostly of shaded fuel breaks in areas identified in the communities at risk section of this plan (these areas are also identified in appendix A "High Priority Pre Fire Projects"). Additionally, LNU has rapidly expanded our efforts and is actively inspecting structures in the SRA, all so citizens may be better educated about their defensible space needs.

A. REDUCE INGRESS/EGRESS HAZARD FROM WILDFIRE

Goal 1: Ingress and Egress Enhancement of Public Roads with Shaded Fuel Breaks and Fuel Reduction.

Objectives:

- a) **Support the availability and utilization of CAL FIRE hand crews and other CAL FIRE resources, as well as public and private sector resources, to treat available fuel inside the road/highway easement, including ongoing maintenance, to improve the safety of which public citizens may evacuate, and emergency resources may access, a fire area.**

Measurement Criteria: *The unit will report via CALMAPPER on the progress of the shaded fuel break projects in the road right-of-ways, including treatment activities and acres treated. Report the number of agreements and/or amount of funding and acres treated that involve grants, SRA Fee funding, or partnerships with federal agencies, resource conservation districts, local FSCs, fire districts, watershed groups or other non-profit or community groups that support the ability to carry out fuels reduction projects.*

B. TRACK DEFENSIBLE SPACE INSPECTION EFFORTS

Goal 2: Create and maintain a single database to track unit LE-100 inspections.

Objectives:

- a) **Create and maintain a basic process to track the status of all LE-100 inspections performed by unit engine companies and Defensible Space Inspectors, including specific violation and construction criteria, inspection status, and location in Degree Decimal Minute format.**

Measurement Criteria: *CAL FIRE The unit will report and produce maps via CALMAPPER and other reporting criteria the efforts of the LE-100 inspection program. The unit will evaluate the ease or complication of the data flow, from entry to report, and make necessary adjustments to balance the thoroughness of data collection with the ease of participation..*

APPENDICES C-Z

LNU MULTIPLE INCIDENT MANAGEMENT PLAN (MIMP)

INTRODUCTION

This plan is designed to assist the unit in managing multiple incidents in a safe, efficient and expedient manner.

OBJECTIVES:

- Identify and prioritize multiple incidents in a timely manner.
- Provide a standard method of managing multiple incidents that may have the potential of escalating and causing immediate draw down of personnel and equipment within the unit.
- Reduce the workload on the ECC.
- Provide an effective method of managing the unit's resources.
- Minimize resource draw down by committing local government resources.
- Provide proper management of radio frequencies.

ACTIVATION

Activation of this plan occur under two circumstances:

1. Intelligence received forecasts the high probability that multiple incidents will have a significant impact on the unit. (Predicted lightning, flooding, etc.)
2. It is obvious the increasing number of incidents is creating an immediate draw down of resources and/or the ECC can no longer support all incidents.

ORGANIZATION

The Multiple Incident Management Plan will be operated in accordance with the Incident Command System.

1. The Unit Duty Chief will function as such for contacts with the Region Duty Chief, the unit Chief, the ICs and the ECC Chief.
2. The North, South, East, and West Division Chiefs or their designee will function as Incident Commanders of their respective Divisions. (North IC, South IC, East IC, West IC).
3. The Unit will function into Operational Battalions in those affected battalions. (13 Operations--Healdsburg Battalion, 17 Operations—Middletown Battalion, 14 Operations—St. Helena Battalion, etc.). The Battalion boundaries will define the Operational Area perimeters unless circumstances require otherwise.
4. Numbering and naming of incidents will be by Battalion number followed by a sequential number. (Bat. 13—Inc. 13-1, 13-2, 13-3, etc.)
5. A Logistics Chief will be assigned to each Division activated and coordinate with the Service Center to provide logistical support within that Division.
6. Two additional vehicles per Division will be staffed with division/group qualified personnel.
7. Pre-designated staging areas will be identified. (Healdsburg FFS, Lake Sonoma Visitor Center, Konocti Camp, Calistoga Fairgrounds, etc.)

DUTYCHIEF

1. Coordinate with North, South, East, and West IC's on Divisional needs and priorities.
2. Determines need for plan activation
3. Coordinates with Region Duty Chief and Unit Chief on Unit needs and priorities.
4. Coordinates with ECC on draw down and Unit needs
5. Ensure callback of all DCs, BCs, Logistical Sec. Chief, Div/Group, ECC Support, Air Attack personnel and Unit Support Team.

INCIDENT COMMANDER

1. Determine need for plan activation within their Division.
2. Prioritize incidents within their Division.
3. Assign Operations Chiefs and coordinate their resource needs.
4. Coordinates assignment of resources to Operational Battalions.
5. Liaison with local government entities on incident status.
6. Track and assign Multiple Incident Management Plan number to incidents within their Division.

OPERATIONS

1. Coordinate with Incident Commander.
2. Determine Operational Battalion resource needs.
3. Prioritize Operational Battalion incidents.
4. Manages and assign resources.
5. Maintain situation unit information on FC 34.
6. Ensures staging and logistical support.
7. Ensure accurate tracking of incidents within their Operational Battalion.

COMMUNICATIONS

1. ECC will assign frequencies to each IC for use in each Division.
2. ECC ensures ICs have incident numbers for all incidents assigned in their Division.
3. ECC coordinates air tanker assignments until an IC or Air Ops is activated.
4. ECC will keep ICs informed of weather forecasts.
5. ECC will dispatch all new non-MIMP incidents and request resources from appropriate divisional IC.

INTELLIGENCE AND DETECTION

The ICs and Operational Battalions will request and use any resources needed for planning or detection of incidents. Air attack will be activated and used in conjunction with fixed detection, suppression and air tanker operations by IC request. Supplemental aircraft will be utilized when needs arise to free air attack for operational needs.

1. Lookouts will report all smokes within SRA to the ECC, identifying type of smoke, bearing, distance, landmarks and location. The ECC will then notify the appropriate IC of the incident.
2. Aerial Recon will be activated and used in conjunction with fixed detection, suppression and air tanker operations.
3. ECC will advise recon aircraft of target areas after checking with ICs.

4. Air Recon will plot smokes using Lat and Longs and report them to the ECC until advised to report directly to the ICs.
5. The ECC or SAAB will order additional recon aircraft as early as possible.
6. Consideration should be given to using a Call When Needed (CWN) aircraft when recon flights are ordered.

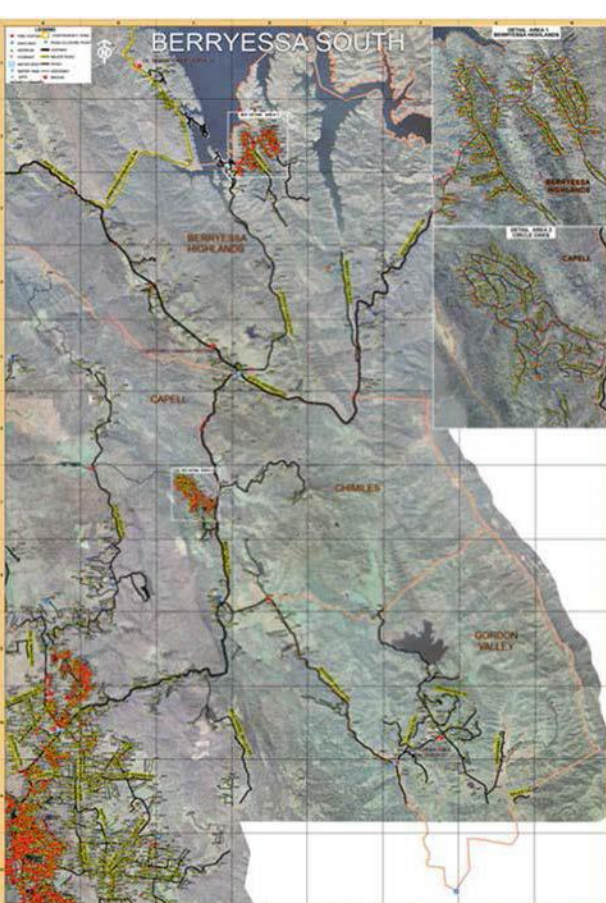

ESCALATING INCIDENT

Any incident that is predicted or escalates beyond the support capabilities of the Operational Battalion will become a separate incident from that IC's responsibilities. An Incident Commander will be assigned and all requests for resources will go through the normal ECC channels and will be run as a separate incident.

DEACTIVATION

A joint decision will be made between Operational Battalions, ICs, Duty Chief and the ECC to deactivate the appropriate Operational Battalion, IC or Plan.

Pre-Attack Map Product examples:

Totals	2,069,352	2,320,293

State Responsibility Area (SRA) is the area of the state where the State of California is financially responsible for the prevention and suppression of wildfires. SRA does not include lands within city boundaries or in federal ownership.

Direct Protection Area (DPA) is the area for which a particular fire protection organization has the primary responsibility for attacking an uncontrolled fire and for directing the suppression action, regardless of Responsibility Area.
